| Appendix B. MC68HSC05J1A .....                | 121 |

# List of Sections

## Table of Contents

### Section 1. General Description

|         |                                               |    |
|---------|-----------------------------------------------|----|
| 1.1     | Contents . . . . .                            | 15 |
| 1.2     | Introduction . . . . .                        | 16 |
| 1.3     | Features . . . . .                            | 16 |
| 1.4     | Mask Options . . . . .                        | 17 |
| 1.5     | MCU Structure . . . . .                       | 18 |
| 1.6     | Pin Assignments . . . . .                     | 19 |
| 1.6.1   | V <sub>DD</sub> and V <sub>SS</sub> . . . . . | 19 |
| 1.6.2   | OSC1 and OSC2 . . . . .                       | 20 |
| 1.6.2.1 | Crystal . . . . .                             | 20 |
| 1.6.2.2 | Ceramic Resonator . . . . .                   | 22 |
| 1.6.2.3 | RC Oscillator . . . . .                       | 23 |
| 1.6.2.4 | External Clock . . . . .                      | 23 |
| 1.6.3   | $\overline{\text{RESET}}$ . . . . .           | 24 |
| 1.6.4   | $\overline{\text{IRQ}}$ . . . . .             | 24 |
| 1.6.5   | PA7–PA0 . . . . .                             | 24 |
| 1.6.6   | PB5–PB0 . . . . .                             | 24 |

### Section 2. Memory

|     |                                      |    |
|-----|--------------------------------------|----|
| 2.1 | Contents . . . . .                   | 25 |
| 2.2 | Introduction . . . . .               | 25 |
| 2.3 | Memory Map . . . . .                 | 25 |
| 2.4 | Input/Output (I/O) Section . . . . . | 26 |
| 2.5 | Random-Access Memory (RAM) . . . . . | 26 |
| 2.6 | Read-Only Memory (ROM) . . . . .     | 26 |

## Section 3. Central Processor Unit (CPU)

|       |                                       |    |
|-------|---------------------------------------|----|
| 3.1   | Contents . . . . .                    | 31 |
| 3.2   | Introduction . . . . .                | 31 |
| 3.3   | CPU Registers . . . . .               | 32 |
| 3.3.1 | Accumulator . . . . .                 | 33 |
| 3.3.2 | Index Register . . . . .              | 33 |
| 3.3.3 | Stack Pointer . . . . .               | 34 |
| 3.3.4 | Program Counter . . . . .             | 35 |
| 3.3.5 | Condition Code Register . . . . .     | 36 |
| 3.4   | Arithmetic/Logic Unit (ALU) . . . . . | 37 |

## Section 4. Interrupts

|         |                                           |    |
|---------|-------------------------------------------|----|
| 4.1     | Contents . . . . .                        | 39 |
| 4.2     | Introduction . . . . .                    | 39 |
| 4.3     | Interrupt Sources . . . . .               | 39 |
| 4.3.1   | Software Interrupt . . . . .              | 40 |
| 4.3.2   | External Interrupts . . . . .             | 40 |
| 4.3.2.1 | IRQ Pin . . . . .                         | 40 |
| 4.3.2.2 | PA3–PA0 Pins . . . . .                    | 42 |
| 4.3.2.3 | IRQ Status and Control Register . . . . . | 43 |
| 4.3.3   | Timer Interrupts . . . . .                | 44 |
| 4.3.3.1 | Timer Overflow Interrupt . . . . .        | 44 |
| 4.3.3.2 | Real-Time Interrupt . . . . .             | 44 |
| 4.4     | Interrupt Processing . . . . .            | 44 |

## Section 5. Resets

|       |                          |    |
|-------|--------------------------|----|
| 5.1   | Contents . . . . .       | 47 |
| 5.2   | Introduction . . . . .   | 47 |
| 5.3   | Reset Types . . . . .    | 48 |
| 5.3.1 | Power-On Reset . . . . . | 48 |
| 5.3.2 | External Reset . . . . . | 49 |

|       |                                                   |    |
|-------|---------------------------------------------------|----|
| 5.3.3 | Computer Operating Properly (COP) Reset . . . . . | 49 |
| 5.3.4 | Illegal Address Reset . . . . .                   | 50 |
| 5.4   | Reset States . . . . .                            | 50 |
| 5.4.1 | CPU . . . . .                                     | 50 |
| 5.4.2 | I/O Port Registers . . . . .                      | 50 |
| 5.4.3 | Multifunction Timer . . . . .                     | 51 |
| 5.4.4 | COP Watchdog . . . . .                            | 51 |

## Section 6. Low-Power Modes

|     |                               |    |
|-----|-------------------------------|----|
| 6.1 | Contents . . . . .            | 53 |
| 6.2 | Introduction . . . . .        | 53 |
| 6.3 | Stop Mode . . . . .           | 53 |
| 6.4 | Wait Mode . . . . .           | 54 |
| 6.5 | Halt Mode . . . . .           | 55 |
| 6.6 | Data-Retention Mode . . . . . | 57 |

## Section 7. Parallel Input/Output (I/O)

|       |                                      |    |
|-------|--------------------------------------|----|
| 7.1   | Contents . . . . .                   | 59 |
| 7.2   | Introduction . . . . .               | 59 |
| 7.3   | I/O Port Function . . . . .          | 59 |
| 7.4   | Port A . . . . .                     | 60 |
| 7.4.1 | Port A Data Register . . . . .       | 60 |
| 7.4.2 | Data Direction Register A . . . . .  | 61 |
| 7.4.3 | Pulldown Register A . . . . .        | 62 |
| 7.4.4 | Port A External Interrupts . . . . . | 63 |
| 7.5   | Port B . . . . .                     | 65 |
| 7.5.1 | Port B Data Register . . . . .       | 65 |
| 7.5.2 | Data Direction Register B . . . . .  | 66 |
| 7.5.3 | Pulldown Register B . . . . .        | 67 |

## Section 8. Multifunction Timer

|     |                                             |    |
|-----|---------------------------------------------|----|
| 8.1 | Contents . . . . .                          | 69 |
| 8.2 | Introduction . . . . .                      | 69 |
| 8.3 | Timer Status and Control Register . . . . . | 71 |
| 8.4 | COP Watchdog . . . . .                      | 74 |

## Section 9. Instruction Set

|       |                                          |    |
|-------|------------------------------------------|----|
| 9.1   | Contents . . . . .                       | 75 |
| 9.2   | Introduction . . . . .                   | 76 |
| 9.3   | Addressing Modes . . . . .               | 76 |
| 9.3.1 | Inherent . . . . .                       | 77 |
| 9.3.2 | Immediate . . . . .                      | 77 |
| 9.3.3 | Direct . . . . .                         | 77 |
| 9.3.4 | Extended . . . . .                       | 77 |
| 9.3.5 | Indexed, No Offset . . . . .             | 78 |
| 9.3.6 | Indexed, 8-Bit Offset . . . . .          | 78 |
| 9.3.7 | Indexed, 16-Bit Offset . . . . .         | 78 |
| 9.3.8 | Relative . . . . .                       | 79 |
| 9.4   | Instruction Types . . . . .              | 79 |
| 9.4.1 | Register/Memory Instructions . . . . .   | 80 |
| 9.4.2 | Read-Modify-Write Instructions . . . . . | 81 |
| 9.4.3 | Jump/Branch Instructions . . . . .       | 82 |
| 9.4.4 | Bit Manipulation Instructions . . . . .  | 84 |
| 9.4.5 | Control Instructions . . . . .           | 85 |
| 9.5   | Instruction Set Summary . . . . .        | 86 |
| 9.6   | Opcode Map . . . . .                     | 91 |

## Section 10. Electrical Specifications

|      |                           |    |
|------|---------------------------|----|
| 10.1 | Contents . . . . .        | 93 |
| 10.2 | Introduction . . . . .    | 93 |
| 10.3 | Maximum Ratings . . . . . | 94 |

|       |                                                 |     |
|-------|-------------------------------------------------|-----|
| 10.4  | Operating Temperature Range. . . . .            | 95  |
| 10.5  | Thermal Characteristics . . . . .               | 95  |
| 10.6  | Power Considerations. . . . .                   | 96  |
| 10.7  | 5.0-Volt DC Electrical Characteristics. . . . . | 97  |
| 10.8  | 3.3-Volt DC Electrical Characteristics. . . . . | 98  |
| 10.9  | 5.0-Volt Control Timing. . . . .                | 103 |
| 10.10 | 3.3-Volt Control Timing. . . . .                | 104 |

## **Section 11. Mechanical Specifications**

|      |                                                                |     |
|------|----------------------------------------------------------------|-----|
| 11.1 | Contents . . . . .                                             | 107 |
| 11.2 | Introduction. . . . .                                          | 107 |
| 11.3 | 20-Pin Plastic Dual In-Line Package (PDIP). . . . .            | 108 |
| 11.4 | 20-Pin Small Outline Integrated Circuit Package (SOIC) . . . . | 108 |

## **Section 12. Ordering Information**

|      |                                        |     |
|------|----------------------------------------|-----|
| 12.1 | Contents . . . . .                     | 109 |
| 12.2 | Introduction. . . . .                  | 109 |
| 12.3 | MCU Ordering Forms . . . . .           | 110 |
| 12.4 | Application Program Media. . . . .     | 110 |
| 12.5 | Diskettes. . . . .                     | 111 |
| 12.6 | EPROMs. . . . .                        | 112 |
| 12.7 | ROM Program Verification . . . . .     | 112 |
| 12.8 | ROM Verification Units (RVUs). . . . . | 113 |

## **Appendix A. MC68HCL05J1A**

|     |                       |     |
|-----|-----------------------|-----|
| A.1 | Contents . . . . .    | 115 |
| A.2 | Introduction. . . . . | 115 |

# Table of Contents

|     |                                     |     |
|-----|-------------------------------------|-----|
| A.3 | DC Electrical Characteristics ..... | 116 |
| A.4 | MC Ordering Information .....       | 119 |

## Appendix B. MC68HSC05J1A

|     |                                     |     |
|-----|-------------------------------------|-----|
| B.1 | Contents .....                      | 121 |
| B.2 | Introduction .....                  | 121 |
| B.3 | DC Electrical Characteristics ..... | 122 |
| B.4 | Control Timing .....                | 123 |
| B.5 | MC Ordering Information .....       | 124 |

## List of Figures

| Figure | Title                                                                            | Page |
|--------|----------------------------------------------------------------------------------|------|
| 1-1    | TK68HC05J1A Block Diagram . . . . .                                              | 18   |
| 1-2    | Pin Assignments. . . . .                                                         | 19   |
| 1-3    | Bypassing Layout Recommendation . . . . .                                        | 20   |
| 1-4    | Crystal Connections<br>with Feedback Resistor Mask Option . . . . .              | 21   |
| 1-5    | Crystal Connections<br>without Feedback Resistor Mask Option . . . . .           | 21   |
| 1-6    | Ceramic Resonator Connections<br>with Feedback Resistor Mask Option . . . . .    | 22   |
| 1-7    | Ceramic Resonator Connections<br>without Feedback Resistor Mask Option . . . . . | 22   |
| 1-8    | RC Oscillator Connections . . . . .                                              | 23   |
| 1-9    | External Clock Connections . . . . .                                             | 23   |
| 2-1    | Memory Map . . . . .                                                             | 27   |
| 2-2    | I/O Register Summary . . . . .                                                   | 28   |
| 3-1    | Programming Model . . . . .                                                      | 32   |
| 3-2    | Accumulator (A) . . . . .                                                        | 33   |
| 3-3    | Index Register (X) . . . . .                                                     | 33   |
| 3-4    | Stack Pointer (SP) . . . . .                                                     | 34   |
| 3-5    | Program Counter (PC) . . . . .                                                   | 35   |
| 3-6    | Condition Code Register (CCR) . . . . .                                          | 36   |
| 4-1    | External Interrupt Logic . . . . .                                               | 41   |
| 4-2    | IRQ Status and Control Register (ISCR) . . . . .                                 | 43   |
| 4-3    | Stacking Order . . . . .                                                         | 45   |
| 4-4    | Interrupt Flowchart . . . . .                                                    | 46   |

## List of Figures

## 1.2 Introduction

The TK68HC05J1A is a member of the low-cost, high-performance TK68HC05 Family of 8-bit microcontroller units (MCU). The TK68HC05 Family is based on the customer-specified integrated circuit (CSIC) design strategy. All MCUs in the family use the popular TK68HC05 central processor unit (CPU) and are available with a variety of subsystems, memory sizes and types, and package types.

On-chip memory of the TK68HC05J1A includes:

- 1240 bytes of user read-only memory (ROM)
- 64 bytes of user random-access memory (RAM)

Information on the TK68HCL05J1A, a low-power version of the TK68HC05J1A, is introduced in **Appendix A. MC68HCL05J1A**.

Information on the TK68HSC05J1A, a high-speed version of the TK68HC05J1A, is introduced in **Appendix B. TK68HSC05J1A**.

## 1.3 Features

Features of the MCU include:

- Popular TK68HC05 CPU
- Memory-mapped input/output (I/O) registers
- 1240 bytes of user ROM including eight user vector locations
- 64 bytes of user RAM
- 14 bidirectional I/O pins with these features:
  - Software programmable pulldown devices
  - Four I/O pins with 8-mA current sinking capability
  - Four I/O pins with maskable external interrupt capability
- Hardware mask and flag for external interrupts
- Fully static operation with no minimum clock speed
- On-chip oscillator with connections for a crystal or ceramic resonator or for a resistor-capacitor ( $R_C$ ) network
- 15-bit multifunction timer

- Computer operating properly (COP) watchdog
- Power-saving stop (or halt), wait, and data-retention modes
- Illegal address reset
- Internal steering diode between  $\overline{\text{RESET}}$  and  $V_{\text{DD}}$  pins
- $8 \times 8$  unsigned multiply instruction
- 20-pin plastic dual in-line package (PDIP)
- 20-pin small outline integrated circuit package (SOIC)

## 1.4 Mask Options

Available TK68HC05J1A mask options are:

- On-chip oscillator connections: crystal/ceramic resonator connections or resistor-capacitor (RC) network connections
- Crystal/ceramic resonator feedback resistor: connected or not connected (available only with crystal/ceramic oscillator mask option)
- STOP instruction: enabled or disabled (converted to WAIT instruction)
- External interrupt pins: edge-triggered or edge- and level-triggered
- Port A and port B pulldown resistors: connected or not connected
- COP watchdog timer: enabled or disabled
- Port A external interrupt capability: enabled or disabled

## 1.5 MCU Structure

Figure 1-1 shows the structure of the TK68HC05J1A MCU.

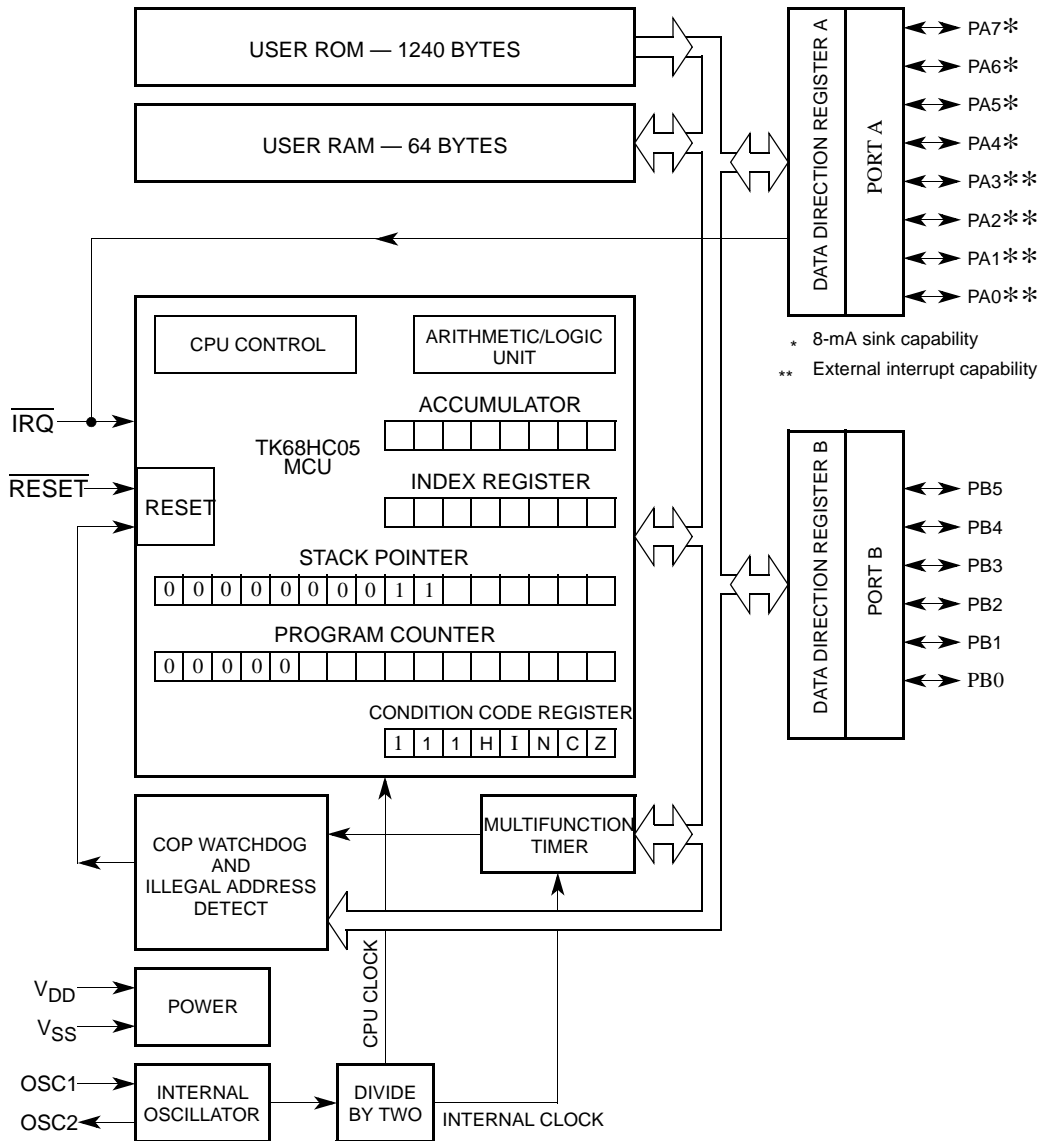

Figure 1-1. TK68HC05J1A Block Diagram

## 1.6 Pin Assignments

**Figure 1-2** shows the TK68HC05J1A pin assignments.

**Figure 1-2. Pin Assignments**

### 1.6.1 V<sub>DD</sub> and V<sub>SS</sub>

V<sub>DD</sub> and V<sub>SS</sub> are the power supply and ground pins. The MCU operates from a single 5-V power supply.

Very fast signal transitions occur on the MCU pins, placing high short-duration current demands on the power supply. To prevent noise problems, take special care to provide good power supply bypassing at the MCU. Place bypass capacitors as close to the MCU as possible, as **Figure 1-3** shows. C2 is an optional bulk current bypass capacitor for use in applications that require the port pins to source high current levels.

**Figure 1-3. Bypassing Layout Recommendation**

## 1.6.2 OSC1 and OSC2

The OSC1 and OSC2 pins are the control connections for the on-chip oscillator. Depending on the mask option selected, the oscillator can be driven by any one of these:

- Crystal
- Ceramic resonator
- Resistor-capacitor (RC) network
- External clock signal

The frequency of the internal oscillator is  $f_{OSC}$ . The MCU divides the internal oscillator output by two to produce the internal clock with a frequency of  $f_{OP}$ .

An internal feedback resistor between the OSC1 and OSC2 pins is available as a mask option. The feedback resistor mask option is available only when the crystal/ceramic resonator mask option is also selected.

### 1.6.2.1 Crystal

With the crystal/ceramic resonator mask option, a crystal connected to the OSC1 and OSC2 pins can drive the on-chip oscillator. [Figure 1-4](#) and [Figure 1-5](#) show a typical crystal oscillator circuit for an AT-cut, parallel resonant crystal. Follow the crystal supplier's recommendations, as the crystal parameters determine the external component values required to provide reliable startup and maximum stability. The load capacitance values used in the oscillator circuit design should include all stray layout capacitances. To minimize output distortion, mount the crystal and capacitors as close as possible to the pins.

**NOTE:** Use an AT-cut crystal and not an AT-strip crystal. The MCU may overdrive an AT-strip crystal.

**Figure 1-4. Crystal Connections with Feedback Resistor Mask Option**

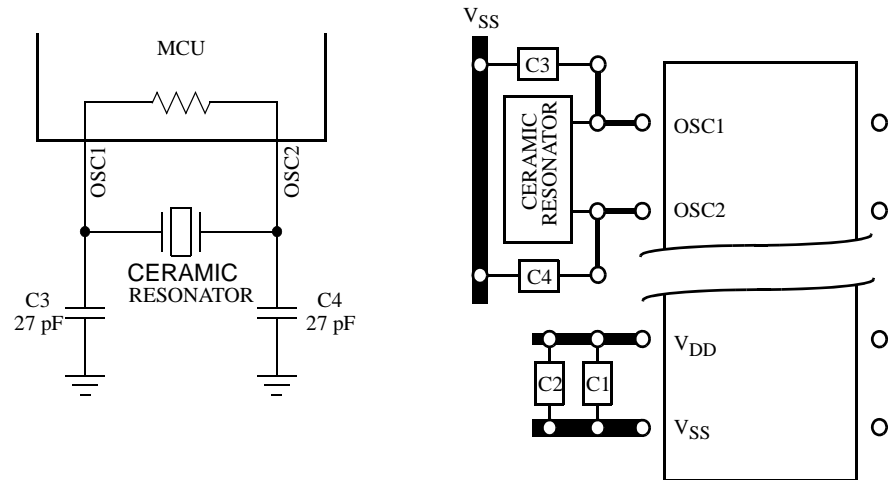

**Figure 1-5. Crystal Connections without Feedback Resistor Mask Option**

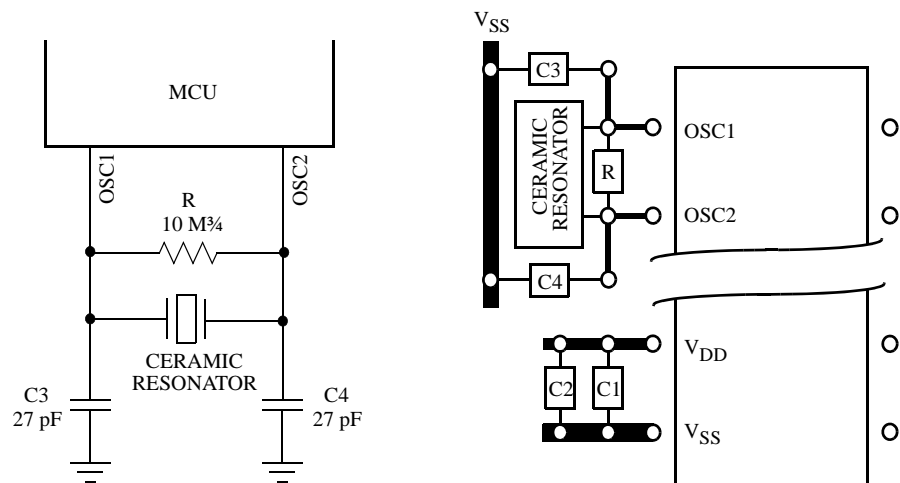

## General Description

### 1.6.2.2 Ceramic Resonator

To reduce cost, use a ceramic resonator in place of the crystal. Use the circuit in [Figure 1-6](#) or [Figure 1-7](#) for a ceramic resonator and follow the resonator manufacturer's recommendations. The load capacitance values used in the oscillator circuit design should include all stray layout capacitances. To minimize output distortion, mount the resonator as close as possible to the pins.

**Figure 1-6. Ceramic Resonator Connections with Feedback Resistor Mask Option**

**Figure 1-7. Ceramic Resonator Connections without Feedback Resistor Mask Option**

### 1.6.2.3 RC Oscillator

For maximum cost reduction, the RC oscillator mask option allows the configuration shown in [Figure 1-8](#) to drive the on-chip oscillator. The OSC2 signal is a square wave, and the signal on OSC1 is a triangular wave. The optimum frequency for the RC oscillator configuration is 2 MHz. Mount the RC components as close as possible to the pins for startup stabilization and to minimize output distortion.

**Figure 1-8. RC Oscillator Connections**

### 1.6.2.4 External Clock

With the RC oscillator mask option, an external clock from another CMOS-compatible device can drive the OSC1 input. Leave the OSC2 pin unconnected, as [Figure 1-9](#) shows.

**Figure 1-9. External Clock Connections**

### 1.6.3 $\overline{\text{RESET}}$

A logic 0 on the  $\overline{\text{RESET}}$  pin forces the MCU to a known startup state. See [5.3.2 External Reset](#) for more information.

### 1.6.4 $\overline{\text{IRQ}}$

The  $\overline{\text{IRQ}}$  pin is an asynchronous external interrupt pin. See [4.3.2.1 IRQ Pin](#).

### 1.6.5 PA7–PA0

PA7–PA0 are the pins of port A, a general-purpose, bidirectional I/O port. See [7.4 Port A](#).

### 1.6.6 PB5–PB0

PB5–PB0 are the pins of port B, a general-purpose, bidirectional I/O port. See [7.5 Port B](#).

## Section 2. Memory

### 2.2 Introduction

This section describes the organization of the on-chip memory.

### 2.3 Memory Map

The central processor unit (CPU) can address 2 Kbytes of memory space as shown in [Figure 2-1](#). The read-only memory (ROM) portion of memory holds the program instructions, fixed data, user-defined vectors, and interrupt service routines. The random-access memory (RAM) portion of memory holds variable data. Input/output (I/O) registers are memory-mapped so that the CPU can access their locations in the same way that it accesses all other memory locations.

## 2.4 Input/Output (I/O) Section

The first 32 addresses of the memory space, \$0001–\$001F, are the I/O section. These are the addresses of the I/O control registers, status registers, and data registers. See [Figure 2-2](#).

One I/O register shown in [Figure 2-2](#) is located outside the 32-byte I/O section: the computer operating properly (COP) register is mapped at \$07F0.

## 2.5 Random-Access Memory (RAM)

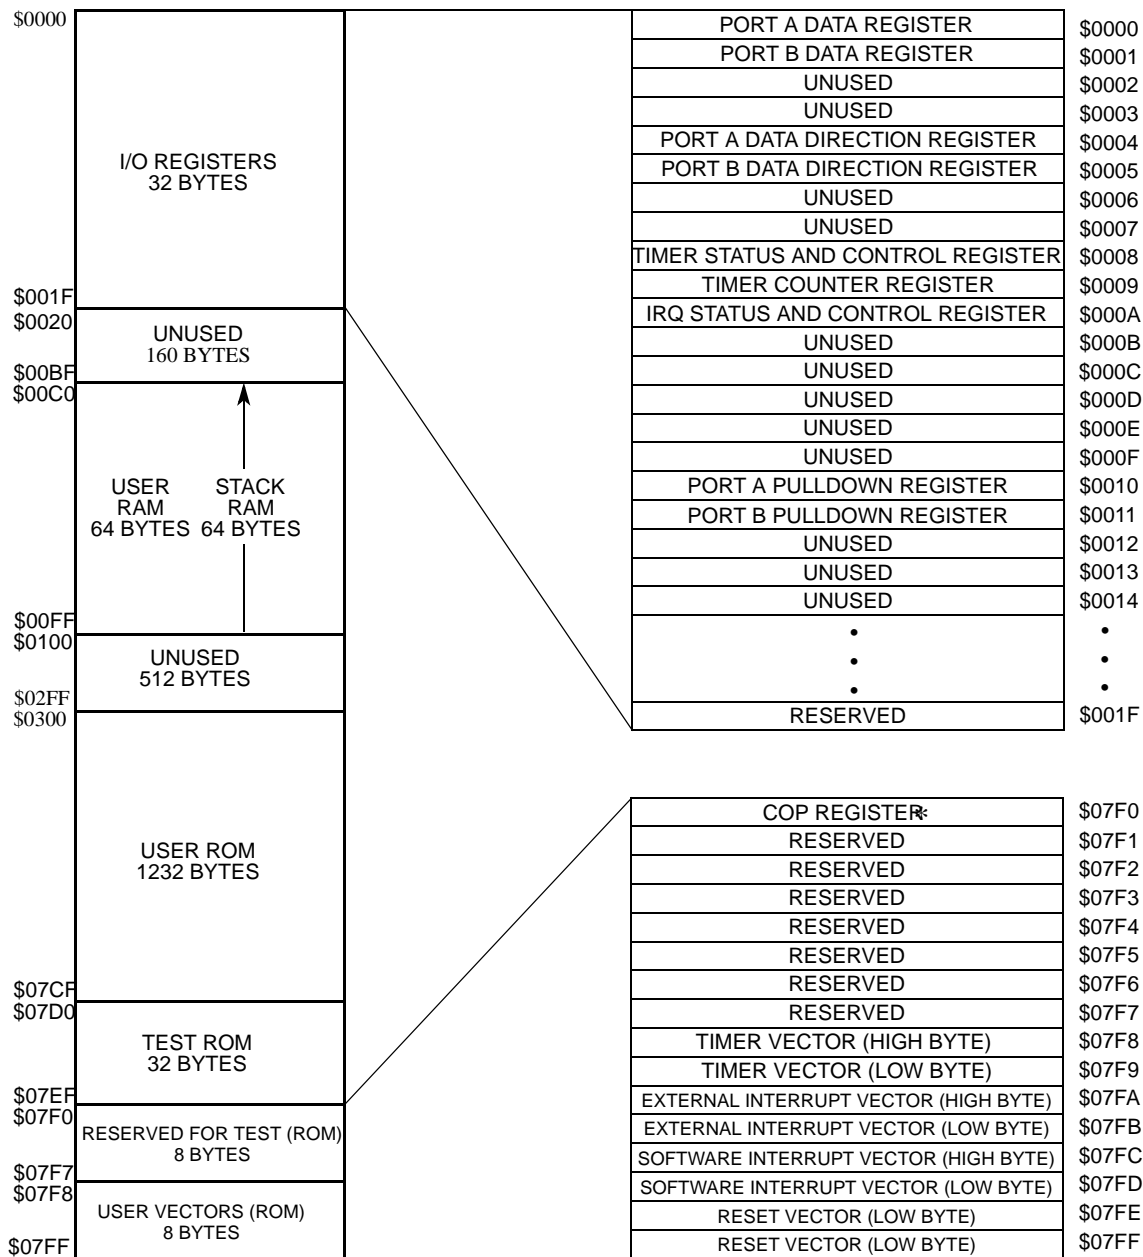

The 64 addresses from \$00C0 to \$00FF serve as both the user RAM and the stack RAM. The CPU uses five stack RAM bytes to save all CPU register contents before processing an interrupt. During a subroutine call, the CPU uses two bytes to store the return address. The stack pointer decrements during pushes and increments during pulls.

**NOTE:** *Be careful when using nested subroutines or multiple interrupt levels. The CPU may overwrite data in the RAM during a subroutine or during the interrupt stacking operation.*

## 2.6 Read-Only Memory (ROM)

The ROM is located in two areas of the memory map:

1. Addresses \$0300–\$07CF contain 1232 bytes of user ROM.
2. Addresses \$07F8–\$07FF contain 16 bytes of ROM reserved for user vectors.

\*Writing to bit 0 of \$07F0 clears the COP watchdog. Reading \$07F0 returns ROM data.

**Figure 2-1. Memory Map**

# Memory

| Addr.  | Register Name                                                    | Bit 7  | 6                   | 5     | 4     | 3     | 2     | 1     | Bit 0 |       |

### 3.2 Introduction

This section describes the central processor unit (CPU) registers.

# Central Processor Unit (CPU)

## 3.3 CPU Registers

Figure 3-1 shows the five CPU registers. CPU registers and are not part of the memory map.

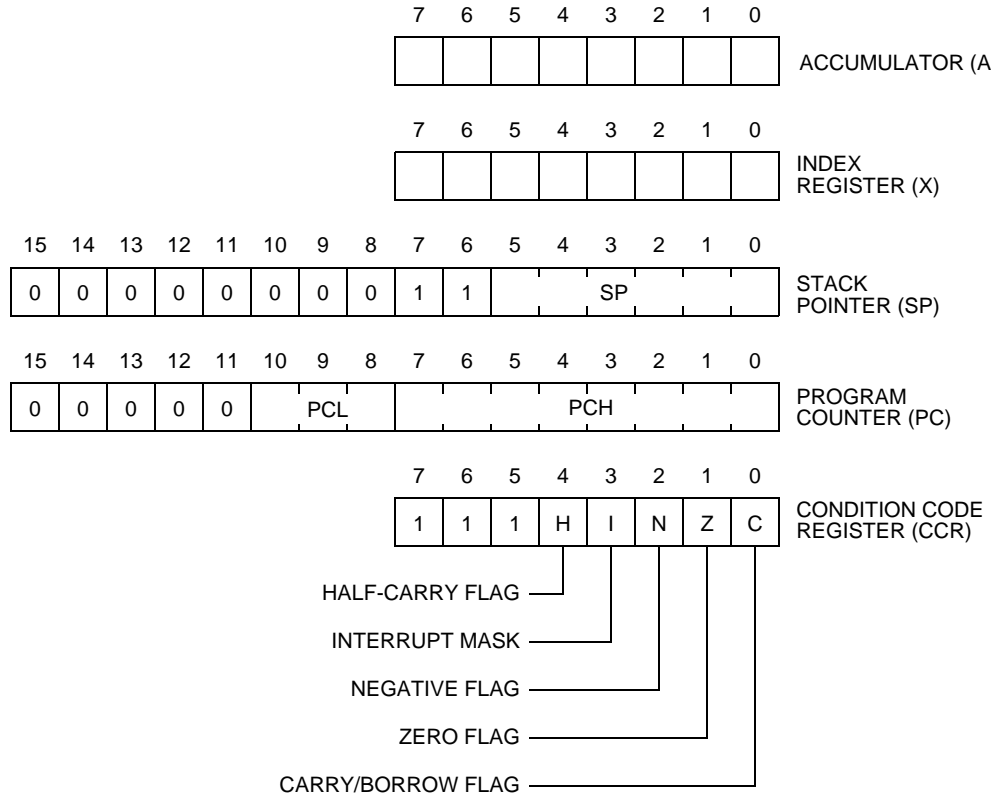

Figure 3-1. Programming Model

### 3.3.1 Accumulator

The accumulator (A) shown in **Figure 3-2** is a general-purpose 8-bit register. The CPU uses the accumulator to hold operands and results of arithmetic and non-arithmetic operations.

**Figure 3-2. Accumulator (A)**

### 3.3.2 Index Register

In the indexed addressing modes, the CPU uses the byte in the index register (X) shown in **Figure 3-3** to determine the conditional address of the operand. See **9.3.5 Indexed, No Offset**, **9.3.6 Indexed, 8-Bit Offset**, and **9.3.7 Indexed, 16-Bit Offset** for more information on indexed addressing.

The 8-bit index register also can serve as a temporary data storage location.

**Figure 3-3. Index Register (X)**

## 3.3.3 Stack Pointer

The stack pointer (SP) shown in **Figure 3-4** is a 16-bit register that contains the address of the next free location on the stack. During a reset or after the reset stack pointer (RSP) instruction, the stack pointer initializes to \$00FF. The address in the stack pointer decrements as data is pushed onto the stack and increments as data is pulled from the stack.

The 10 most significant bits of the stack pointer are fixed permanently at 0000000011, so the stack pointer produces addresses from \$00C0 to \$00FF. If subroutines and interrupts use more than 64 stack locations, the stack pointer wraps around to address \$00FF and begins writing over the previously stored data. A subroutine uses two stack locations. An interrupt uses five locations.

|         | Bit 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | Bit 0 |
|---------|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| Read:   | 0      | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0     |
| Write:  |        |    |    |    |    |    |   |   |   |   |   |   |   |   |   |       |
| Re-set: | 0      | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1     |

= Unimplemented

**Figure 3-4. Stack Pointer (SP)**

### 3.3.4 Program Counter

The program counter (PC) shown in **Figure 3-5** is a 16-bit register that contains the address of the next instruction or operand to be fetched. The five most significant bits of the program counter are ignored internally and appear as 00000.

Normally, the address in the program counter automatically increments to the next sequential memory location every time an instruction or operand is fetched. Jump, branch, and interrupt operations load the program counter with an address other than that of the next sequential location.

**Figure 3-5. Program Counter (PC)**

## 3.3.5 Condition Code Register

The condition code register (CCR) shown in **Figure 3-6** is an 8-bit register whose three most significant bits are permanently fixed at 111. The condition code register contains the interrupt mask and four flags that indicate the results of prior instructions.

|        | Bit 7 | 6 | 5 | 4 | 3 | 2 | 1 | Bit 0 |
|--------|-------|---|---|---|---|---|---|-------|
| Read:  | 1     | 1 | 1 | H | I | N | Z | C     |
| Write: |       |   |   |   |   |   |   |       |
| Reset: | 1     | 1 | 1 | U | 1 | U | U | U     |

= Unimplemented
 U = Unaffected

**Figure 3-6. Condition Code Register (CCR)**

## H — Half-Carry Flag

The CPU sets the half-carry flag when a carry occurs between bits 3 and 4 of the accumulator during an add without carry (ADD) or add with carry (ADC) operation. The half-carry bit is required for binary-coded decimal (BCD) arithmetic operations. Reset has no effect on the half-carry flag.

### I — Interrupt Mask Flag

Setting the interrupt mask (I) disables interrupts. If an interrupt request occurs while the interrupt mask is a logic 0, the CPU saves the CPU registers on the stack, sets the interrupt mask, and then fetches the interrupt vector. If an interrupt request occurs while the interrupt mask is set, the interrupt request is latched. The CPU processes the latched interrupt as soon as the interrupt mask is cleared again.

A return-from-interrupt (RTI) instruction pulls the CPU registers from the stack, restoring the interrupt mask to its cleared state. After a reset, the interrupt mask is set and can be cleared only by a clear interrupt mask bit (CLI), STOP, or WAIT instruction.

### N — Negative Flag

The CPU sets the negative flag when an arithmetic operation, logical operation, or data manipulation produces a negative result (bit 7 in the results is a logic 1). Reset has no effect on the negative flag.

### Z — Zero Flag

The CPU sets the zero flag when an arithmetic operation, logical operation, or data manipulation produces a result of \$00. Reset has no effect on the zero flag.

### C — Carry/Borrow Flag

The CPU sets the carry/borrow flag when an addition operation produces a carry out of bit 7 of the accumulator or when a subtraction operation requires a borrow. Some logical operations and data manipulation instructions also clear or set the carry/borrow bit. Reset has no effect on the carry/borrow flag.

## 3.4 Arithmetic/Logic Unit (ALU)

The arithmetic/logic unit (ALU) performs the arithmetic and logical operations defined by the instruction set. The binary arithmetic circuits decode instructions and set up the ALU for the selected operation. Most binary arithmetic is based on the addition algorithm, carrying out subtraction as negative addition. Multiplication is not performed as a discrete operation but as a chain of addition and shift operations within the ALU. The multiply instruction requires 11 internal clock cycles to complete this chain of operations.

### 4.2 Introduction

This section describes how interrupts temporarily change the normal processing sequence.

### 4.3 Interrupt Sources

These sources can generate interrupt requests:

- SWI (software interrupt) instruction
- $\overline{\text{IRQ}}$  pin
- PA3–PA0 pins (mask option)
- Multifunction timer

An interrupt temporarily stops normal program execution to process a particular event. An interrupt does not stop the execution of the instruction in progress, but takes effect when the current instruction completes its execution. Interrupt processing automatically saves the central processor unit (CPU) registers on the stack and loads the program counter with a user-defined vector address.

## 4.3.1 Software Interrupt

The software interrupt (SWI) instruction causes a non-maskable interrupt.

## 4.3.2 External Interrupts

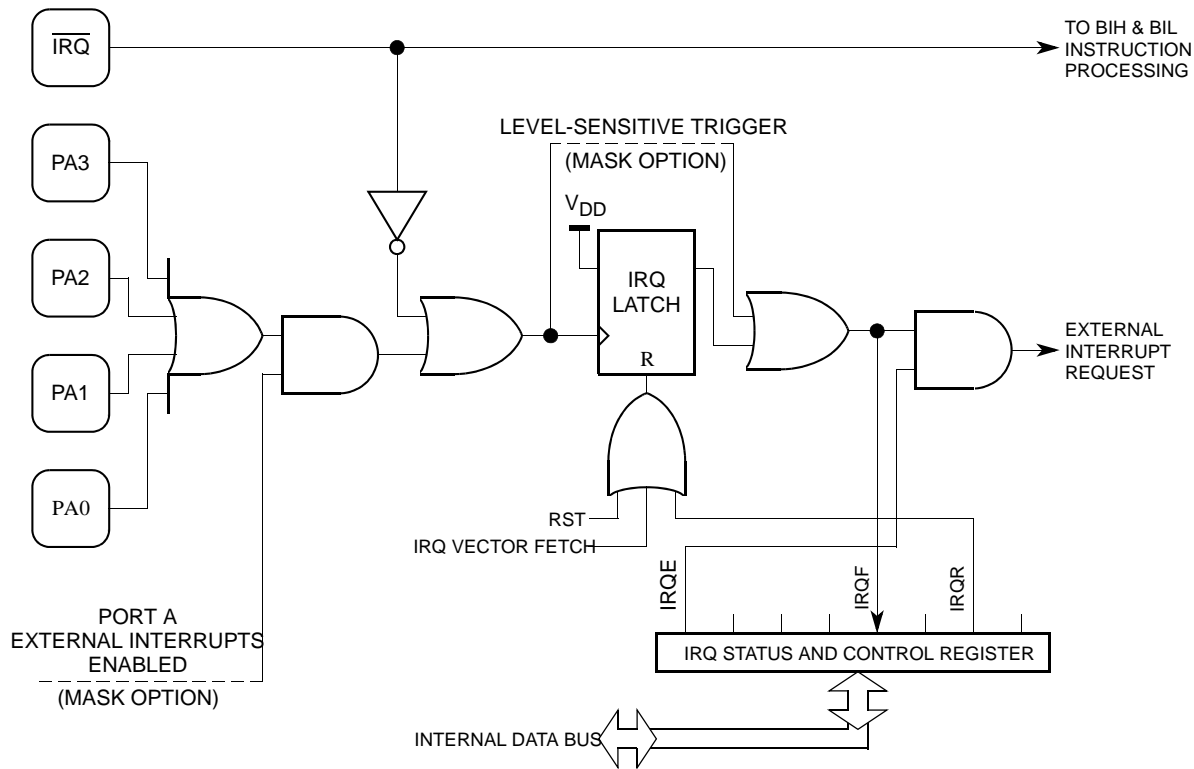

These sources can generate external interrupts:

- $\overline{\text{IRQ}}$  pin
- PA3–PA0 pins (mask option)

Setting the I bit in the condition code register or clearing the IRQE bit in the interrupt status and control register disables external interrupts.

### 4.3.2.1 $\overline{\text{IRQ}}$ Pin

An interrupt signal on the  $\overline{\text{IRQ}}$  pin latches an external interrupt request. When the CPU completes its current instruction, it tests the IRQ latch. If the IRQ latch is set, the CPU then tests the I bit in the condition code register and the IRQE bit in the interrupt status and control register. If the I bit is clear and the IRQE bit is set, the CPU then begins the interrupt sequence. The CPU clears the IRQ latch while it fetches the interrupt vector, so that another external interrupt request can be latched during the interrupt service routine. As soon as the I bit is cleared during the return from interrupt, the CPU can recognize the new interrupt request. **Figure 4-1** shows the external interrupt logic.

**Figure 4-1. External Interrupt Logic**

External interrupt triggering sensitivity is a mask option. The  $\overline{\text{IRQ}}$  pin can be negative edge-triggered only or negative edge- and low level-triggered.

With the mask option for an edge- and level-sensitive external interrupt trigger, a falling edge or a low level on the  $\overline{\text{IRQ}}$  pin latches an external interrupt request. Edge- and level-sensitive triggering allows the use of multiple wired-OR external interrupt sources. An external interrupt request is latched as long as any source is holding the  $\overline{\text{IRQ}}$  pin low.

With the mask option for an edge-sensitive only external interrupt trigger, a falling edge on the  $\overline{\text{IRQ}}$  pin latches an external interrupt request. A subsequent external interrupt request can be latched only after the voltage level on the  $\overline{\text{IRQ}}$  pin returns to logic 1 and then falls again to logic 0.

## 4.3.2.2 PA3–PA0 Pins

The mask option for port A external interrupts enables pins PA3–PA0 to serve as additional external interrupt sources. An interrupt signal on a PA3–PA0 pin latches an external interrupt request. After completing the current instruction, the CPU tests the IRQ latch. If the IRQ latch is set, the CPU then tests the I bit in the condition code register and the IRQE bit in the interrupt status and control register. If the I bit is clear and the IRQE bit is set, the CPU then begins the interrupt sequence. The CPU clears the IRQ latch while it fetches the interrupt vector, so that another external interrupt request can be latched during the interrupt service routine. As soon as the I bit is cleared during the return from interrupt, the CPU can recognize the new interrupt request.

External interrupt triggering sensitivity is a mask option. The PA3–PA0 pins can be positive edge-triggered only or positive edge- and high level-triggered.

With the mask option for an edge- and level-sensitive external interrupt trigger, a rising edge or a high level on a PA3–PA0 pin latches an external interrupt request. Edge- and level-sensitive triggering allows the use of multiple wired-OR external interrupt sources. As long as any source is holding a PA3–PA0 pin high, an external interrupt request is latched, and the CPU continues to execute the interrupt service routine.

With the mask option for an edge-sensitive only external interrupt trigger, a rising edge on a PA3–PA0 pin latches an external interrupt request. A subsequent external interrupt request can be latched only after the voltage level of the previous interrupt signal returns to logic 0 and then rises again to logic 1.

### 4.3.2.3 IRQ Status and Control Register

The IRQ status and control register (ISCR), shown in **Figure 4-2**, contains an external interrupt mask, an external interrupt flag, and a flag reset bit.

**Figure 4-2. IRQ Status and Control Register (ISCR)**

**IRQE** — External Interrupt Request Enable Bit

This read/write bit enables external interrupts. Resets set the IRQE bit.

- 1 = External interrupt processing enabled
- 0 = External interrupt processing disabled

**IRQF** — External Interrupt Request Flag

The IRQ flag is a clearable, read-only bit that is set when an external interrupt request is pending. Resets clear the IRQF bit.

- 1 = Interrupt request pending
- 0 = No interrupt request pending

These conditions set the IRQ flag:

- a. An external interrupt signal on the  $\overline{\text{IRQ}}$  pin
- b. An external interrupt signal on pin PA3, PA2, PA1, or PA0 when PA3–PA0 are enabled to serve as external interrupt sources

The CPU clears the IRQ flag when fetching the interrupt vector.

Writing to the IRQ flag has no effect. Clear the IRQ flag by writing a logic 1 to the IRQR bit.

**IRQR** — Interrupt Request Reset Bit

This write-only bit clears the IRQ flag.

- 1 = IRQF bit cleared

0 = No effect

## 4.3.3 Timer Interrupts

The multifunction timer can generate these interrupts:

- Timer overflow interrupt
- Real-time interrupt

Setting the I bit in the condition code register disables timer interrupts.

### 4.3.3.1 Timer Overflow Interrupt

A timer overflow interrupt request occurs if the timer overflow flag, TOF, becomes set while the timer overflow interrupt enable bit, TOIE, is also set. See **8.3 Timer Status and Control Register**.

### 4.3.3.2 Real-Time Interrupt

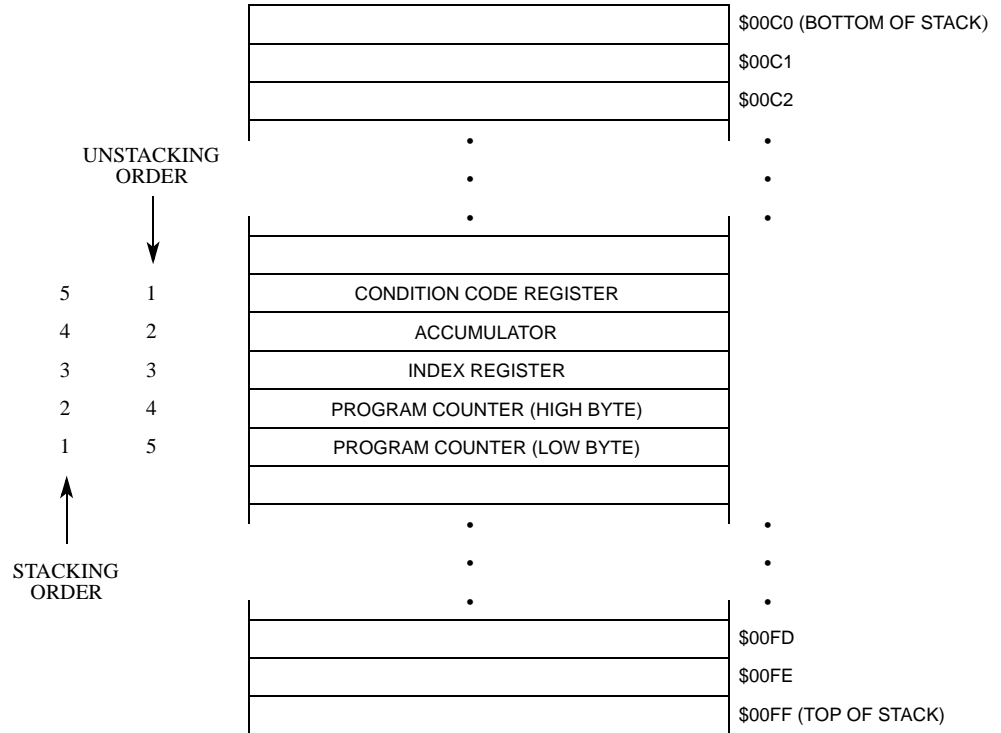

A real-time interrupt request occurs if the real-time interrupt flag, RTIF, becomes set while the real-time interrupt enable bit, RTIE, is also set. See **8.3 Timer Status and Control Register**.

## 4.4 Interrupt Processing

The CPU takes these actions to begin servicing an interrupt:

- Stores the CPU registers on the stack in the order shown in **Figure 4-3**
- Sets the I bit in the condition code register to prevent further interrupts
- Loads the program counter with the contents of the appropriate interrupt vector locations:
  - \$07FC and \$07FD (software interrupt vector)
  - \$07FA and \$07FB (external interrupt vector)
  - \$07F8 and \$07F9 (timer interrupt vector)

The return-from-interrupt (RTI) instruction causes the CPU to recover the CPU registers from the stack as shown in **Figure 4-3**.

**Figure 4-3. Stacking Order**

**Table 4-1** summarizes the reset and interrupt sources and vector assignments.

**Table 4-1. Reset/Interrupt Vector Addresses**

| Function                 | Source                                                                                      | Local Mask | Global Mask | Priority (1 = Highest)       | Vector Address |

### 5.2 Introduction

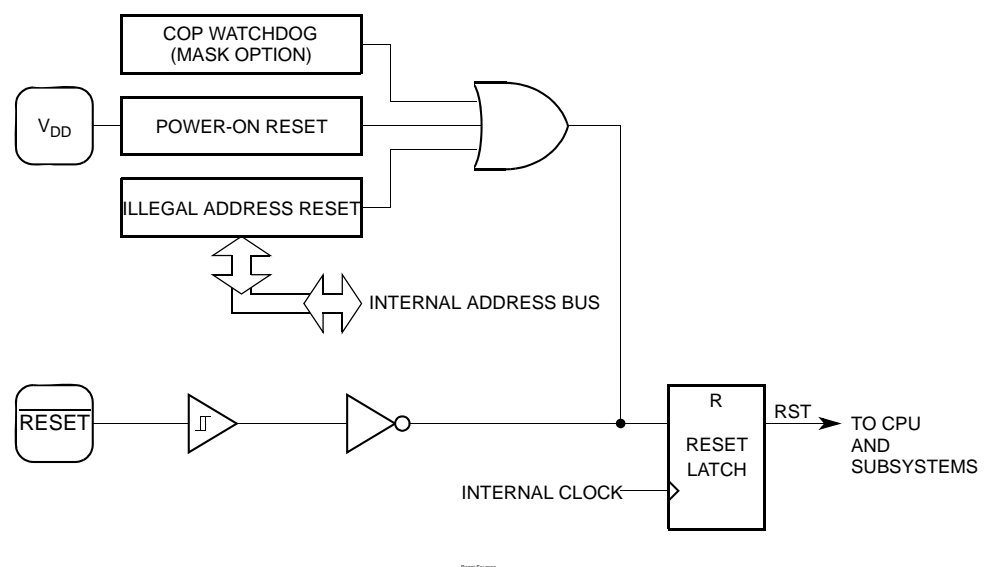

This section describes the four reset sources and how they initialize the microcontroller unit (MCU).

## 5.3 Reset Types

A reset immediately stops the operation of the instruction being executed, initializes certain control bits, and loads the program counter with a user-defined reset vector address. These conditions produce a reset:

- Initial power-up (power-on reset)
- A logic 0 applied to the  $\overline{\text{RESET}}$  pin (external reset)
- Timeout of the mask-optional computer operating properly (COP) watchdog (COP reset)
- An opcode fetch from an address not in the memory map (illegal address reset)

is a block diagram of the reset sources.

### 5.3.1 Power-On Reset

A positive transition on the  $V_{DD}$  pin generates a power-on reset. The power-on reset is strictly for power-up conditions and cannot be used to detect drops in power supply voltage.

A  $4064 t_{CYC}$  (internal clock cycle) delay after the oscillator becomes active allows the clock generator to stabilize. If the  $\overline{\text{RESET}}$  pin is at logic 0

at the end of  $4064 t_{CYC}$ , the MCU remains in the reset condition until the signal on the  $\overline{RESET}$  pin goes to logic 1.

### 5.3.2 External Reset

A logic 0 applied to the  $\overline{RESET}$  pin for one and one-half  $t_{CYC}$  generates an external reset. A Schmitt trigger senses the logic level at the  $\overline{RESET}$  pin.

### 5.3.3 Computer Operating Properly (COP) Reset

A timeout of the COP watchdog generates a COP reset. The COP watchdog is part of a software error detection system and must be cleared periodically to start a new timeout period. See **8.4 COP Watchdog**.

To clear the COP watchdog and prevent a COP reset, write a logic 0 to bit 0 (COPC) of the COP register at location \$07F0. The COP register, shown in **Figure 5-1**, is a write-only register that returns the contents of a ROM location when read.

The COP watchdog function is a mask option.

**Figure 5-1. COP Register (COPR)**

#### COPC — COP Clear Bit

COPC is a write-only bit. Periodically writing a logic 0 to COPC prevents the COP watchdog from resetting the MCU.

## 5.3.4 Illegal Address Reset

An opcode fetch from an address that is not in the ROM (locations \$0300–\$07FF) or the RAM (locations \$00C0–\$00FF) generates an illegal address reset.

## 5.4 Reset States

This subsection describes how resets initialize the MCU.

### 5.4.1 CPU

A reset has the following effects on the CPU:

- Loads the stack pointer with \$FF
- Sets the I bit in the condition code register, inhibiting interrupts
- Sets the IRQE bit in the interrupt status and control register
- Loads the program counter with the user-defined reset vector from locations \$07FE and \$07FF
- Clears the stop latch, enabling the CPU clock
- Clears the wait latch, waking the CPU from the wait mode

### 5.4.2 I/O Port Registers

A reset has these effects on I/O port registers:

- Clears bits DDRA7–DDRA0 in data direction register A so that port A pins are inputs
- Clears bits PDIA7–PDIA0 in pulldown register A so that port A pulldown devices are enabled
- Clears bits DDRB5–DDR B0 in data direction register B so that port B pins are inputs
- Clears bits PDIB5–PDIB0 in pulldown register B so that port B pulldown devices are enabled
- Has no effect on port A or port B data registers

### 5.4.3 Multifunction Timer

A reset has these effects on the multifunction timer:

- Clears the timer status and control register
- Clears the timer counter register

### 5.4.4 COP Watchdog

A reset clears the COP watchdog, if the COP watchdog is enabled by mask option.

## Section 6. Low-Power Modes

### 6.1 Contents

|     |                           |    |
|-----|---------------------------|----|
| 6.2 | Introduction .....        | 53 |
| 6.3 | Stop Mode .....           | 53 |
| 6.4 | Wait Mode .....           | 54 |
| 6.5 | Halt Mode .....           | 55 |
| 6.6 | Data-Retention Mode ..... | 57 |

### 6.2 Introduction

This section describes the four low-power modes:

- Stop mode
- Wait mode
- Halt mode (mask option)
- Data-retention mode

### 6.3 Stop Mode

The STOP instruction puts the microcontroller unit (MCU) in its lowest power-consumption mode and has these effects on the MCU:

- Clears TOF and RTIF, the timer interrupt flags in the timer status and control register, removing any pending timer interrupts
- Clears TOIE and RTIE, the timer interrupt enable bits in the timer status and control register, disabling further timer interrupts
- Clears the multifunction timer counter

- Sets the IRQE bit in the IRQ status and control register to enable external interrupts
- Clears the I bit in the condition code register, enabling interrupts
- Stops the internal oscillator, turning off the central processor unit (CPU) clock and the timer clock, including the computer operating properly (COP) watchdog

The STOP instruction does not affect any other registers or any input/output (I/O) lines.

These conditions bring the MCU out of stop mode:

- An external interrupt signal on the  $\overline{\text{IRQ}}$  pin — A high-to-low transition on the  $\overline{\text{IRQ}}$  pin loads the program counter with the contents of locations \$07FA and \$07FB.
- An external interrupt signal on a port A external interrupt pin — If the mask option for the port A external interrupt function is selected, a low-to-high transition on a PA3–PA0 pin loads the program counter with the contents of locations \$07FA and \$07FB.
- External reset — A logic 0 on the  $\overline{\text{RESET}}$  pin resets the MCU and loads the program counter with the contents of locations \$07FE and \$07FF.

When the MCU exits stop mode, processing resumes after a stabilization delay of 4064 oscillator cycles.

### 6.4 Wait Mode

The WAIT instruction puts the MCU in an intermediate power-consumption mode and has these effects on the MCU:

- Clears the I bit in the condition code register, enabling interrupts
- Sets the IRQE bit in the IRQ status and control register, enabling external interrupts
- Stops the central processor unit (CPU) clock, but allows the internal oscillator and timer clock to continue to run

The WAIT instruction does not affect any other registers or any I/O lines.

These conditions restart the CPU clock and bring the MCU out of wait mode:

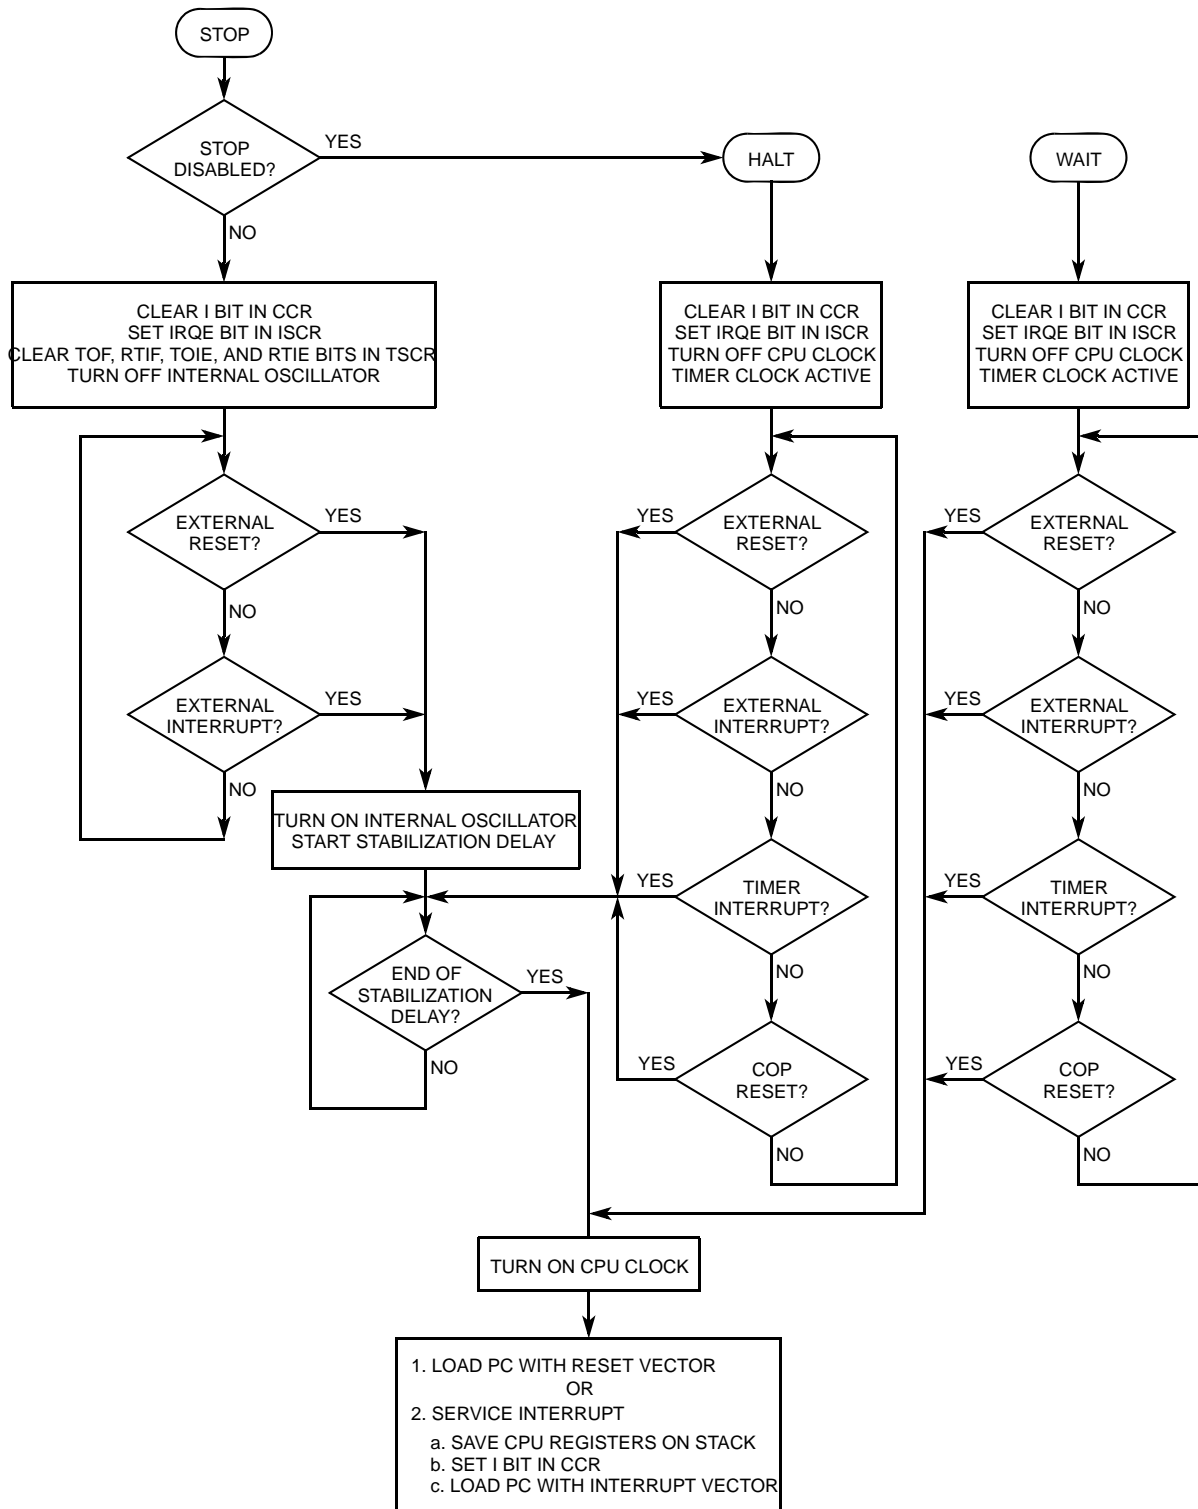

- An external interrupt signal on the  $\overline{\text{IRQ}}$  pin — A high-to-low transition on the  $\overline{\text{IRQ}}$  pin loads the program counter with the contents of locations \$07FA and \$07FB.
- An external interrupt signal on a port A external interrupt pin — If the mask option for the port A external interrupt function is selected, a low-to-high transition on a PA3–PA0 pin loads the program counter with the contents of locations \$07FA and \$07FB.
- A timer interrupt — A timer overflow or a real-time interrupt request loads the program counter with the contents of locations \$07F8 and \$07F9.
- A COP watchdog reset — A timeout of the mask-optional COP watchdog resets the MCU and loads the program counter with the contents of locations \$07FE and \$07FF. Software can enable real-time interrupts so that the MCU can periodically exit wait mode to reset the COP watchdog.
- External reset — A logic 0 on the  $\overline{\text{RESET}}$  pin resets the MCU and loads the program counter with the contents of locations \$07FE and \$07FF.

## 6.5 Halt Mode

If the mask option to disable the STOP instruction is selected, a STOP instruction puts the MCU in halt mode. The halt mode is identical to the wait mode, except that a recovery delay of 1–4064 internal clock cycles occurs when the MCU exits the halt mode. If the mask option to disable the STOP instruction is selected, the COP watchdog cannot be inadvertently turned off by a STOP instruction.

**Figure 6-1** shows the sequence of events in stop, wait, and halt modes.

# Low-Power Modes

**Figure 6-1. Stop/Wait/Halt Flowchart**

## 6.6 Data-Retention Mode

In data-retention mode, the MCU retains random-access memory (RAM) contents and CPU register contents at  $V_{DD}$  voltages as low as 2.0 Vdc. The data-retention feature allows the MCU to remain in a low power-consumption state during which it retains data, but the CPU cannot execute instructions.

To put the MCU in data-retention mode:

1. Drive the  $\overline{\text{RESET}}$  pin to logic 0.
2. Lower the  $V_{DD}$  voltage. The  $\overline{\text{RESET}}$  pin must remain low continuously during data-retention mode.

To take the MCU out of data-retention mode:

1. Return  $V_{DD}$  to normal operating voltage.
2. Return the  $\overline{\text{RESET}}$  pin to logic 1.

### 7.2 Introduction

This section describes the two bidirectional input/output (I/O) ports.

### 7.3 I/O Port Function

The 14 bidirectional I/O pins form two parallel I/O ports. Each I/O pin is programmable as an input or an output. The contents of the data direction registers determine the data direction of each I/O pin.

All 14 I/O pins have mask-optional, software-programmable pulldown devices.

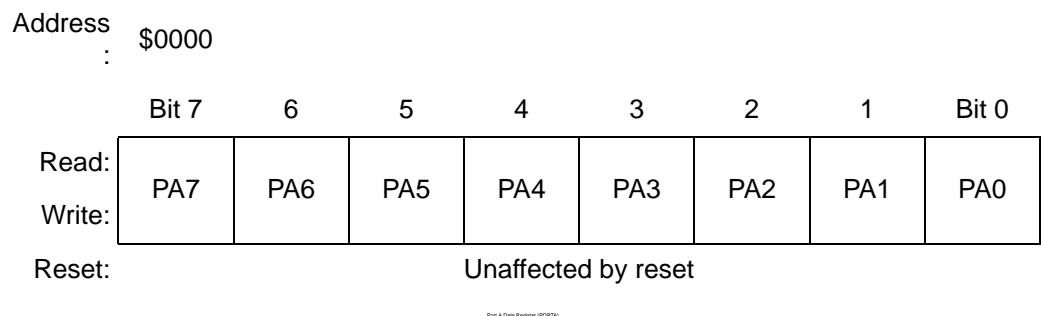

## 7.4 Port A

Port A is an 8-bit, general-purpose, bidirectional I/O port with these features:

- Programmable pulldown devices (mask option)
- 8-mA current sinking capability (pins PA7–PA4)
- External interrupt capability (mask option: pins PA3–PA0)

### 7.4.1 Port A Data Register

The port A data register (PORTA) contains a bit for each of the port A pins. When a port A pin is programmed to be an output, the state of its data register bit determines the state of the output pin. When a port A pin is programmed to be an input, reading the port A data register returns the logic state of the pin.

#### PA7–PA0 — Port A Data Bits

**These read/write bits are software-programmable. Data direction of each bit is under the control of the corresponding bit in data direction register A. Resets have no effect on port A data.**

## 7.4.2 Data Direction Register A

The contents of data direction register A (DDRA) determine whether each port A pin is an input or an output. Writing a logic 1 to a DDRA bit enables the output buffer for the associated port A pin; a logic 0 disables the output buffer. A reset initializes all DDRA bits to 0, configuring all port A pins as inputs.

**Figure 7-1. Data Direction Register A (DDRA)**

DDRA7–DDRA0 — Port A Data Direction Bits

**These read/write bits control port A data direction.**

1 = Corresponding port A pin configured as output

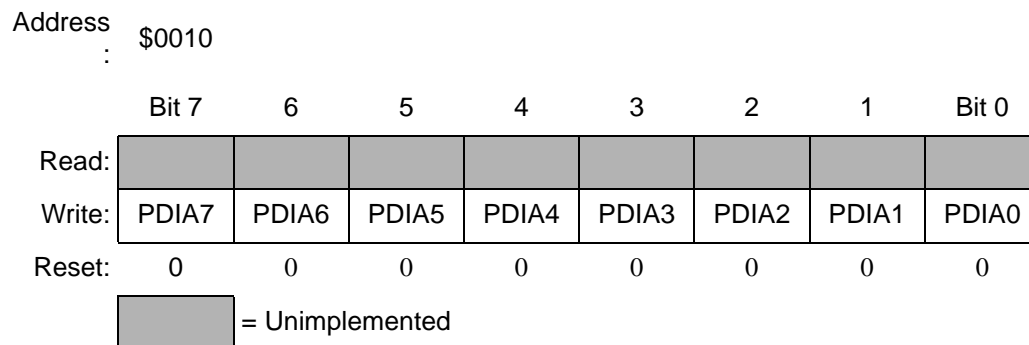

0 = Corresponding port A pin configured as input

**NOTE:** *Avoid glitches on port A pins by writing to the port A data register before changing DDRA bits from logic 0 to logic 1.*

## 7.4.3 Pulldown Register A

All port A pins have mask-optional, programmable pulldown devices that typically sink 100  $\mu$ A. Clearing the PDIA7–PDIA0 bits in pulldown register A (PDRA) turns on the pulldown devices. See [Figure 7-2](#).

Pulldown register A can turn on a port A pulldown device only when the port A pin is an input. Reset clears the PDIA7–PDIA0 bits, turning on all the port A pulldown devices.

**Figure 7-2. Pulldown Register A (PDRA)**

PDIA7–PDIA0 — Port A Pulldown Inhibit Bits

**Writing logic 0s to these write-only bits turns on the port A pulldown devices. Reading pulldown register A returns undefined data.**

1 = Corresponding port A pin pulldown device turned off

0 = Corresponding port A pin pulldown device turned on

**NOTE:** *Avoid a floating port A input by clearing its pulldown register bit before changing its DDRA bit from logic 1 to logic 0.*

*Do not use read-modify-write instructions on pulldown register A.*

### 7.4.4 Port A External Interrupts

If the port A external interrupt mask option is selected, the PA3–PA0 pins serve as external interrupt pins in addition to the  $\overline{IRQ}$  pin.

External interrupt triggering sensitivity is a mask option. The PA3–PA0 pins can be positive edge-triggered or positive edge- and high level-triggered.

**NOTE:** When testing for external interrupts, the BIH and BIL instructions test the voltage on the  $\overline{IRQ}$  pin, not the state of the internal IRQ signal. Therefore, BIH and BIL cannot test the port A external interrupt pins.

Figure 7-3 shows the port A I/O logic.

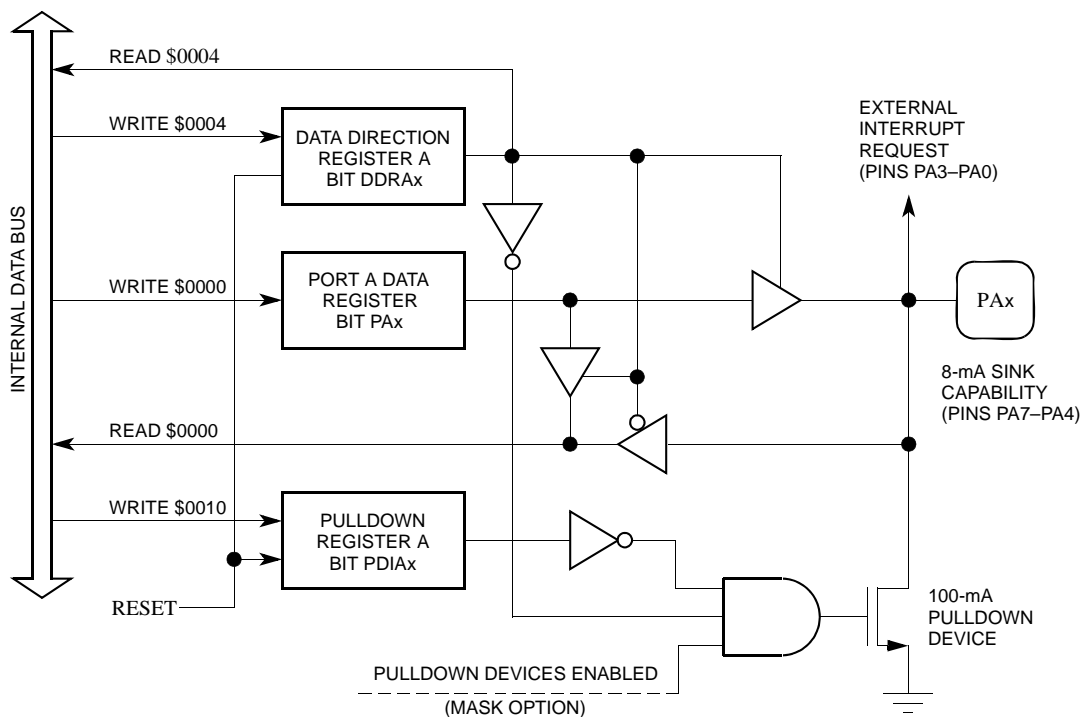

Figure 7-3. Port A I/O Circuit

## Parallel Input/Output (I/O)

When a port A pin is programmed as an output, reading the port bit actually reads the value of the data latch and not the voltage on the pin itself. When a port A pin is programmed as an input, reading the port bit reads the voltage level on the pin. The data latch can always be written, regardless of the state of its DDR bit. [Table 7-1](#) summarizes the operations of the port A pins.

**Table 7-1. Port A Pin Functions**

| Pulldown Mask Option | Control Bits     |       | I/O Pin Mode        | Accesses to PDRA |             | Accesses to DDRA | Accesses to PORTA |         |
|----------------------|------------------|-------|---------------------|------------------|-------------|------------------|-------------------|---------|
|                      | PDIAx            | DDRAx |                     | Read             | Write       | Read/Write       | Read              | Write   |
| No                   | X <sup>(1)</sup> | 0     | Input, hi-z         | U <sup>(2)</sup> | PDIA7–PDIA0 | DDRA7–DDRA0      | Pin               | PA7–PA0 |
| No                   | X                | 1     | Output              | U                | PDIA7–PDIA0 | DDRA7–DDRA0      | PA7–PA0           | PA7–PA0 |

2. U = Undefined

## 7.5 Port B

Port B is a 6-bit, general-purpose, bidirectional I/O port with programmable pulldown devices.

### 7.5.1 Port B Data Register

The port B data register (PORTB) contains a bit for each of the port B pins. When a port B pin is programmed to be an output, the state of its data register bit determines the state of the output pin. When a port B pin is programmed to be an input, reading the port B data register returns the logic state of the pin.

**Figure 7-4. Port B Data Register (PORTB)**

PB5–PB0 — Port B Data Bits

**These read/write bits are software programmable. Data direction of each bit is under the control of the corresponding bit in the port B data direction register.**

Bits 7 and 6 — Not used

**Bits 7 and 6 always read as logic 0s. Writes to these bits have no effect.**

## 7.5.2 Data Direction Register B

The contents of data direction register B (DDRB) determine whether each port B pin is an input or an output. Writing a logic 1 to a DDRB bit enables the output buffer for the associated port B pin; a logic 0 disables the output buffer. A reset initializes all DDRB bits to logic 0, configuring all port B pins as inputs.

**Figure 7-5. Data Direction Register B (DDRB)**

DDRB5–DDRB0 — Data Direction Bits

**These read/write bits control port B data direction.**

1 = Corresponding port B pin configured as output

0 = Corresponding port B pin configured as input

Bit 7 and 6 — Not used

**Bits 7 and 6 always read as logic 0s. Writes to these bits have no effect.**

**NOTE:** *Avoid glitches on port B pins by writing to the port B data register before changing DDRB bits from logic 0 to logic 1.*

### 7.5.3 Pulldown Register B

All port B pins have mask-optional, programmable pulldown devices that typically sink 100  $\mu$ A. Clearing any of the PDIB5–PDIB0 bits in pulldown register B (PDRB) turns on the pulldown devices. See [Figure 7-6](#).

Pulldown register B can turn on a port B pulldown device only when the port B pin is an input. Reset clears bits PDIB5–PDIB0, turning on the port B pulldown devices.

**Figure 7-6. Pulldown Register B (PDRB)**

PDIB5–PDIB0 — Pulldown Inhibit Bits

**Writing logic 0s to these write-only bits turns on the port B pulldown devices. Reading pulldown register B returns undefined data.**

- 1 = Corresponding port B pin pulldown device turned off
- 0 = Corresponding port B pin pulldown device turned on

Bits 7 and 6 — Not used

**NOTE:** *Avoid a floating port B input by clearing its pulldown register bit before changing its DDRB bit from logic 1 to logic 0.*

*Do not use read-modify-write instructions on pulldown register B.*

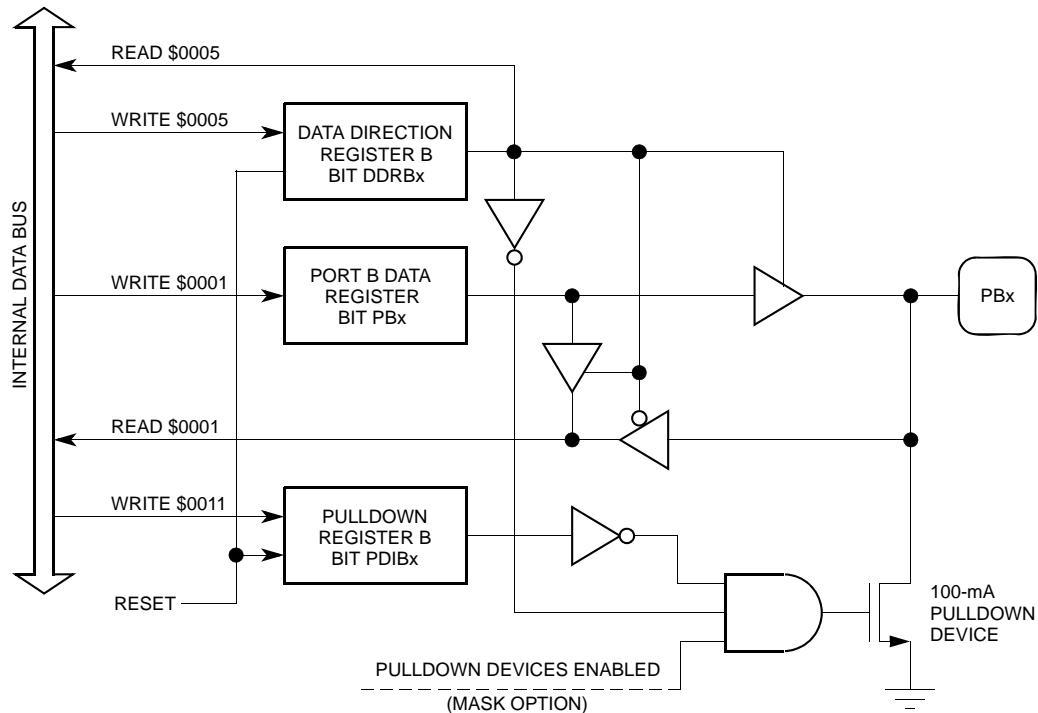

[Figure 7-7](#) shows the port B I/O logic.

Reading a port B output actually reads the value of the data latch and not the voltage on the pin itself. When a port B pin is programmed as an input, reading the port bit reads the voltage level on the pin. The data

# Parallel Input/Output (I/O)

latch can always be written, regardless of the state of its DDR bit.

**Table 7-2** summarizes the operation of the port B pins.

**Figure 7-7. Port B I/O Circuit**

**Table 7-2. Port B Pin Functions**

| Pulldown Mask Option | Control Bits     |       | I/O Pin Mode         | Accesses to PDRB |             | Accesses to DDRB | Accesses to PORTB |         |

### 8.2 Introduction

This section describes the operation of the multifunction timer and the computer operating properly (COP) watchdog. **Figure 8-1** shows the organization of the timer subsystem.

# Multifunction Timer

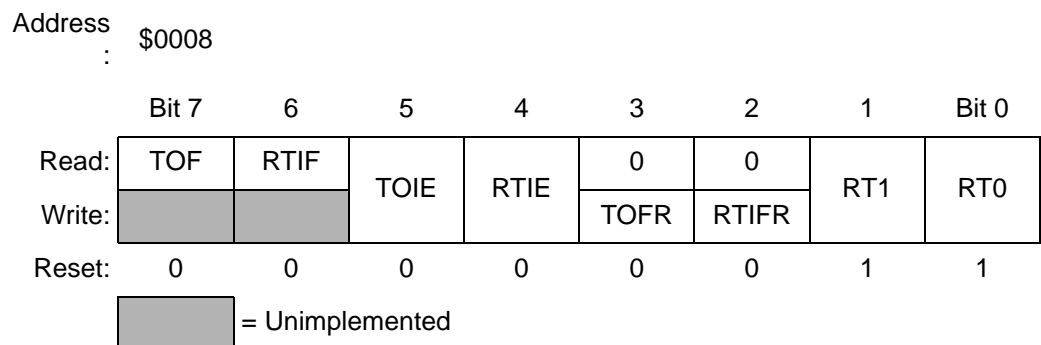

**Figure 8-1. Multifunction Timer Block Diagram**

### 8.3 Timer Status and Control Register

The read/write timer status and control register (TSCR) contains these bits:

- Timer interrupt enable bits
- Timer interrupt flags
- Timer interrupt flag reset bits
- Timer interrupt rate select bits

**Figure 8-2. Timer Status and Control Register (TSCR)**

#### TOF — Timer Overflow Flag

This read-only flag becomes set when the first eight stages of the counter roll over from \$FF to \$00. TOF generates a timer overflow interrupt request if TOIE is also set. Clear TOF by writing a logic 1 to the TOFR bit. Writing to TOF has no effect. Reset clears TOF.

#### RTIF — Real-Time Interrupt Flag

This read-only flag becomes set when the selected real-time interrupt (RTI) output becomes active. RTIF generates a real-time interrupt request if RTIE is also set. Clear RTIF by writing a logic 1 to the RTIFR bit. Writing to RTIF has no effect. Reset clears RTIF.

#### TOIE — Timer Overflow Interrupt Enable Bit

This read/write bit enables timer overflow interrupts.

- 1 = Timer overflow interrupts enabled
- 0 = Timer overflow interrupts disabled

## RTIE — Real-Time Interrupt Enable Bit

This read/write bit enables real-time interrupts.

- 1 = Real-time interrupts enabled
- 0 = Real-time interrupts disabled

## TOFR — Timer Overflow Flag Reset Bit

Writing a logic 1 to this write-only bit clears the TOF bit. TOFR always reads as logic 0. Reset clears TOFR.

## RTIFR — Real-Time Interrupt Flag Reset Bit

Writing a logic 1 to this write-only bit clears the RTIF bit. RTIFR always reads as logic 0. Reset clears RTIFR.

## RT1 and RT0 — Real-Time Interrupt Select Bits 1 and 0

These read/write bits select one of four RTI rates, as shown in [Table 8-1](#). Because the selected RTI output drives the COP watchdog, changing the real-time interrupt rate also changes the counting rate of the COP watchdog. Reset sets RT1 and RT0.

**NOTE:** *Changing RT1 and RT0 when a COP timeout is imminent or uncertain may cause a real-time interrupt request to be missed or an additional real-time interrupt request to be generated. Clear the COP timer just before changing RT1 and RT0.*

**Table 8-1. Real-Time Interrupt Rate Selection**

| RT1:RT0 | Number of Cycles to RTI | RTI Period <sup>(1)</sup> | Number of Cycles to COP Reset | COP Timeout Period <sup>(1)</sup> |
|---------|-------------------------|---------------------------|-------------------------------|-----------------------------------|
| 0 0     | $2^{14} = 16,384$       | 8.2 ms                    | $2^{17} = 131,072$            | 65.5 ms                           |
| 0 1     | $2^{15} = 32,768$       | 16.4 ms                   | $2^{18} = 262,144$            | 131.1 ms                          |
| 1 0     | $2^{16} = 65,536$       | 32.8 ms                   | $2^{19} = 524,288$            | 262.1 ms                          |
| 1 1     | $2^{17} = 131,072$      | 65.5 ms                   | $2^{20} = 1,048,576$          | 524.3 ms                          |

1. At 2-MHz bus, 4-MHz XTAL, 0.5  $\mu$ s per cycle

A 15-stage ripple counter is the core of the timer. The value of the first eight stages is readable at any time from the read-only timer counter register (TCNTR).

**Figure 8-3. Timer Counter Register (TCNTR)**

Power-on clears the entire counter chain and begins clocking the counter. After 4064 cycles, the power-on reset circuit is released, clearing the counter again and allowing the MCU to come out of reset.

A timer overflow function at the eighth counter stage allows a timer interrupt every 1024 internal clock cycles.

## 8.4 COP Watchdog

Four counter stages at the end of the timer make up the mask-optional computer operating properly (COP) watchdog. (See [Figure 8-4](#).)

The COP watchdog is a software error detection system that automatically times out and resets the MCU if not cleared periodically by a program sequence. Writing a logic 0 to bit 0 of the COP register clears the COP watchdog and prevents a COP reset.

**Figure 8-4. COP Register (COPR)**

### COPC — COP Clear Bit

This write-only bit resets the COP watchdog. Reading address \$07F0 returns the ROM data at that address.

**NOTE:** *The STOP instruction turns off the COP watchdog. In applications that depend on the COP watchdog, the STOP instruction can be disabled by a mask option.*

## 9.2 Introduction

The microcontroller unit (MCU) instruction set has 62 instructions and uses eight addressing modes. The instructions include all those of the M146805 CMOS Family plus one more: the unsigned multiply (MUL) instruction. The MUL instruction allows unsigned multiplication of the contents of the accumulator (A) and the index register (X). The high-order product is stored in the index register, and the low-order product is stored in the accumulator.

## 9.3 Addressing Modes

The central processor unit (CPU) uses eight addressing modes for flexibility in accessing data. The addressing modes provide eight different ways for the CPU to find the data required to execute an instruction.

The eight addressing modes are:

- Inherent
- Immediate
- Direct
- Extended
- Indexed, no offset
- Indexed, 8-bit offset
- Indexed, 16-bit offset
- Relative

### 9.3.1 Inherent

Inherent instructions are those that have no operand, such as return from interrupt (RTI) and stop (STOP). Some of the inherent instructions act on data in the CPU registers, such as set carry flag (SEC) and increment accumulator (INCA). Inherent instructions require no operand address and are one byte long.

### 9.3.2 Immediate

Immediate instructions are those that contain a value to be used in an operation with the value in the accumulator or index register. Immediate instructions require no operand address and are two bytes long. The opcode is the first byte, and the immediate data value is the second byte.

### 9.3.3 Direct

Direct instructions can access any of the first 256 memory locations with two bytes. The first byte is the opcode, and the second is the low byte of the operand address. In direct addressing, the CPU automatically uses \$00 as the high byte of the operand address.

### 9.3.4 Extended

Extended instructions use three bytes and can access any address in memory. The first byte is the opcode; the second and third bytes are the high and low bytes of the operand address.

When using the Tekmos assembler, the programmer does not need to specify whether an instruction is direct or extended. The assembler automatically selects the shortest form of the instruction.

## 9.3.5 Indexed, No Offset

Indexed instructions with no offset are 1-byte instructions that can access data with variable addresses within the first 256 memory locations. The index register contains the low byte of the effective address of the operand. The CPU automatically uses \$00 as the high byte, so these instructions can address locations \$0000–\$00FF.

Indexed, no offset instructions are often used to move a pointer through a table or to hold the address of a frequently used RAM or I/O location.

## 9.3.6 Indexed, 8-Bit Offset

Indexed, 8-bit offset instructions are 2-byte instructions that can access data with variable addresses within the first 511 memory locations. The CPU adds the unsigned byte in the index register to the unsigned byte following the opcode. The sum is the effective address of the operand. These instructions can access locations \$0000–\$01FE.

Indexed 8-bit offset instructions are useful for selecting the kth element in an n-element table. The table can begin anywhere within the first 256 memory locations and could extend as far as location 510 (\$01FE). The k value is typically in the index register, and the address of the beginning of the table is in the byte following the opcode.

## 9.3.7 Indexed, 16-Bit Offset

Indexed, 16-bit offset instructions are 3-byte instructions that can access data with variable addresses at any location in memory. The CPU adds the unsigned byte in the index register to the two unsigned bytes following the opcode. The sum is the effective address of the operand. The first byte after the opcode is the high byte of the 16-bit offset; the second byte is the low byte of the offset.

Indexed, 16-bit offset instructions are useful for selecting the kth element in an n-element table anywhere in memory.

As with direct and extended addressing, the Tekmos assembler determines the shortest form of indexed addressing.

### 9.3.8 Relative

Relative addressing is only for branch instructions. If the branch condition is true, the CPU finds the effective branch destination by adding the signed byte following the opcode to the contents of the program counter. If the branch condition is not true, the CPU goes to the next instruction. The offset is a signed, two's complement byte that gives a branching range of  $-128$  to  $+127$  bytes from the address of the next location after the branch instruction.

When using the Tekmos assembler, the programmer does not need to calculate the offset, because the assembler determines the proper offset and verifies that it is within the span of the branch.

## 9.4 Instruction Types

The MCU instructions fall into five categories:

- Register/memory instructions
- Read-modify-write instructions
- Jump/branch instructions
- Bit manipulation instructions
- Control instructions

## 9.4.1 Register/Memory Instructions

These instructions operate on CPU registers and memory locations. Most of them use two operands. One operand is in either the accumulator or the index register. The CPU finds the other operand in memory.

**Table 9-1. Register/Memory Instructions**

| Instruction                                         | Mnemonic |
|-----------------------------------------------------|----------|
| Add memory byte and carry bit to accumulator        | ADC      |
| Add memory byte to accumulator                      | ADD      |
| AND memory byte with accumulator                    | AND      |
| Bit test accumulator                                | BIT      |
| Compare accumulator                                 | CMP      |
| Compare index register with memory byte             | CPX      |
| Exclusive OR accumulator with memory byte           | EOR      |
| Load accumulator with memory byte                   | LDA      |
| Load Index register with memory byte                | LDX      |
| Multiply                                            | MUL      |
| OR accumulator with memory byte                     | ORA      |
| Subtract memory byte and carry bit from accumulator | SBC      |
| Store accumulator in memory                         | STA      |
| Store index register in memory                      | STX      |
| Subtract memory byte from accumulator               | SUB      |

## 9.4.2 Read-Modify-Write Instructions

These instructions read a memory location or a register, modify its contents, and write the modified value back to the memory location or to the register.

**NOTE:** *Do not use read-modify-write operations on write-only registers.*

**Table 9-2. Read-Modify-Write Instructions**

| Instruction                         | Mnemonic            |
|-------------------------------------|---------------------|
| Arithmetic shift left (same as LSL) | ASL                 |
| Arithmetic shift right              | ASR                 |
| Bit clear                           | BCLR <sup>(1)</sup> |
| Bit set                             | BSET <sup>(1)</sup> |
| Clear register                      | CLR                 |
| Complement (one's complement)       | COM                 |
| Decrement                           | DEC                 |
| Increment                           | INC                 |
| Logical shift left (same as ASL)    | LSL                 |
| Logical shift right                 | LSR                 |
| Negate (two's complement)           | NEG                 |
| Rotate left through carry bit       | ROL                 |
| Rotate right through carry bit      | ROR                 |
| Test for negative or zero           | TST <sup>(2)</sup>  |

1. Unlike other read-modify-write instructions, BCLR and BSET use only direct addressing.
2. TST is an exception to the read-modify-write sequence because it does not write a replacement value.

## 9.4.3 Jump/Branch Instructions

Jump instructions allow the CPU to interrupt the normal sequence of the program counter. The unconditional jump instruction (JMP) and the jump-to-subroutine instruction (JSR) have no register operand. Branch instructions allow the CPU to interrupt the normal sequence of the program counter when a test condition is met. If the test condition is not met, the branch is not performed.

The BRCLR and BRSET instructions cause a branch based on the state of any readable bit in the first 256 memory locations. These 3-byte instructions use a combination of direct addressing and relative addressing. The direct address of the byte to be tested is in the byte following the opcode. The third byte is the signed offset byte. The CPU finds the effective branch destination by adding the third byte to the program counter if the specified bit tests true. The bit to be tested and its condition (set or clear) is part of the opcode. The span of branching is from  $-128$  to  $+127$  from the address of the next location after the branch instruction. The CPU also transfers the tested bit to the carry/borrow bit of the condition code register.

**Table 9-3. Jump and Branch Instructions**

| Instruction                                | Mnemonic |
|--------------------------------------------|----------|
| Branch if carry bit clear                  | BCC      |
| Branch if carry bit set                    | BCS      |
| Branch if equal                            | BEQ      |
| Branch if half-carry bit clear             | BHCC     |
| Branch if half-carry bit set               | BHCS     |

## 9.4.4 Bit Manipulation Instructions

The CPU can set or clear any writable bit in the first 256 bytes of memory, which includes I/O registers and on-chip RAM locations. The CPU can also test and branch based on the state of any bit in any of the first 256 memory locations.

**Table 9-4. Bit Manipulation Instructions**

| Instruction         | Mnemonic |
|---------------------|----------|
| Bit clear           | BCLR     |
| Branch if bit clear | BRCLR    |
| Branch if bit set   | BRSET    |
| Bit set             | BSET     |

### 9.4.5 Control Instructions

These instructions act on CPU registers and control CPU operation during program execution.

**Table 9-5. Control Instructions**

| Instruction                                            | Mnemonic |
|--------------------------------------------------------|----------|
| Clear carry bit                                        | CLC      |
| Clear interrupt mask                                   | CLI      |
| No operation                                           | NOP      |
| Reset stack pointer                                    | RSP      |
| Return from interrupt                                  | RTI      |
| Return from subroutine                                 | RTS      |
| Set carry bit                                          | SEC      |
| Set interrupt mask                                     | SEI      |
| Stop oscillator and enable $\overline{\text{IRQ}}$ pin | STOP     |
| Software interrupt                                     | SWI      |
| Transfer accumulator to index register                 | TAX      |
| Transfer index register to accumulator                 | TXA      |
| Stop CPU clock and enable interrupts                   | WAIT     |

## 9.5 Instruction Set Summary

Table 9-6. Instruction Set Summary (Sheet 1 of 6)

### 10.2 Introduction

This section contains electrical and timing specifications.

## 10.3 Maximum Ratings

Maximum ratings are the extreme limits to which the MCU can be exposed without permanently damaging it.

The MCU contains circuitry to protect the inputs against damage from high static voltages; however, do not apply voltages higher than those shown in the table here. Keep  $V_{in}$  and  $V_{out}$  within the range  $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$ . Connect unused inputs to the appropriate voltage level, either  $V_{SS}$  or  $V_{DD}$ .

| Rating <sup>(1)</sup>                                    | Symbol   | Value                               | Unit |
|----------------------------------------------------------|----------|-------------------------------------|------|
| Supply voltage                                           | $V_{DD}$ | -0.3 to +7.0                        | V    |
| Input voltage                                            | $V_{in}$ | $V_{SS} - 0.3$<br>to $V_{DD} + 0.3$ | V    |
| Current drain per pin excluding $V_{DD}$<br>and $V_{SS}$ | I        | 25                                  | mA   |
| Storage temperature range                                | TSTG     | -65 to +150                         | °C   |

1. Voltages referenced to  $V_{SS}$

**NOTE:** *This device is not guaranteed to operate properly at the maximum ratings. Refer to **10.7 5.0-Volt DC Electrical Characteristics** and **10.8 3.3-Volt DC Electrical Characteristics** for guaranteed operating conditions.*

## 10.4 Operating Temperature Range

| Rating                                                                                                                                                                  | Symbol | Value                                                | Unit |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------------------------------------------------------|------|

1. P = Plastic dual in-line package (PDIP)
2. DW = Small outline integrated circuit (SOIC)
3. C = Extended temperature range (–40°C to +85°C)
4. V = Automotive temperature range (–40°C to +105°C)

## 10.5 Thermal Characteristics

| Characteristic                                                                  | Symbol        | Value    | Unit |
|---------------------------------------------------------------------------------|---------------|----------|------|
| Maximum junction temperature                                                    | $T_J$         | 150      | °C   |
| Thermal resistance<br>MC68HC05K1P <sup>(1)</sup><br>MC68HC05K1DW <sup>(2)</sup> | $\theta_{JA}$ | 68<br>85 | °C/W |

1. P = Plastic dual in-line package (PDIP)
2. DW = Small outline integrated circuit (SOIC)

## 10.6 Power Considerations

The average chip junction temperature,  $T_J$ , in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad (1)$$

Where:

$T_A$  = ambient temperature in °C

$\theta_{JA}$  = package thermal resistance, junction to ambient in °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{CC} \times V_{CC}$  = chip internal power dissipation

$P_{I/O}$  = power dissipation on input and output pins (user-determined)

For most applications,  $P_{I/O} < P_{INT}$  and can be neglected.

Ignoring  $P_{I/O}$ , the relationship between  $P_D$  and  $T_J$  is approximately:

$$P_D = \frac{K}{T_J + 273^\circ\text{C}} \quad (2)$$

Solving equations (1) and (2) for K gives:

$$= P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad (3)$$

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving equations (1) and (2) iteratively for any value of  $T_A$ .

## 10.7 5.0-Volt DC Electrical Characteristics

| Characteristic <sup>(1)</sup>                                                                                     | Symbol                | Min                 | Typ                      | Max                    | Unit                           |

| PA3–PA0 interrupt pulse period                                                                                                          | $t_{IHIH}$       | (4)               | —                        | $t_{CYC}$ |
| OSC1 pulse width                                                                                                                        | $t_{OH}, t_{OL}$ | 200               | —                        | ns        |

1.  $V_{DD} = 5.0 \text{ Vdc} \pm 10\%$ ;  $V_{SS} = 0 \text{ Vdc}$ ;  $T_A = T_L$  to  $T_H$

2. Use only AT-cut crystals.

3. The 2-bit timer prescaler is the limiting factor in determining timer resolution.

4. The minimum period,  $t_{LIL}$  or  $t_{IHIH}$ , should not be less than the number of cycles required to execute the interrupt service routine plus  $19 t_{CYC}$ .

2. Use only AT-cut crystals.

3. The 2-bit timer prescaler is the limiting factor in determining timer resolution.

4. The minimum period,  $t_{LIL}$  or  $t_{HIH}$ , should not be less than the number of cycles required to execute the interrupt service routine plus  $19 t_{CYC}$ .

**Figure 10-8. External Interrupt Timing**

Notes:

1. Internal clocking from OSC1 pin
2. Edge-triggered external interrupt mask option
3. Edge- and level-triggered external interrupt mask option
4. Reset vector shown as example

**Figure 10-9. Stop Mode Recovery Timing**

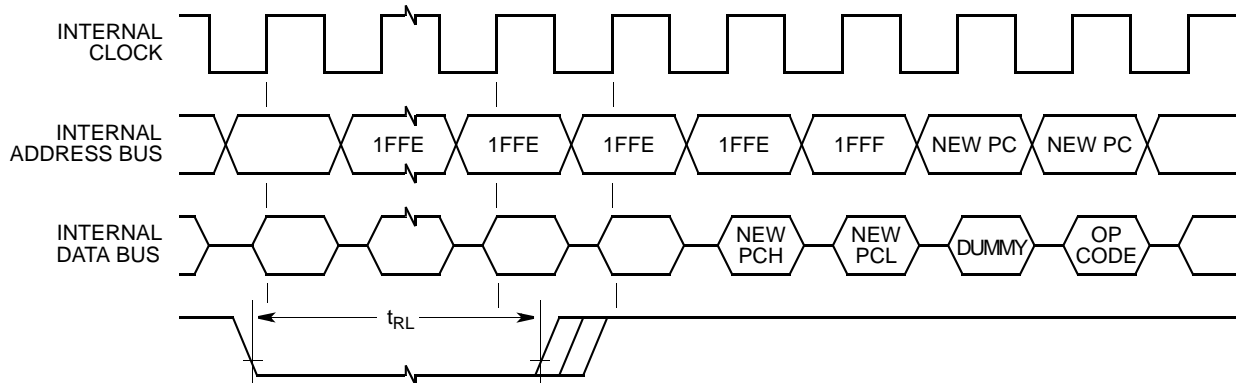

# Electrical Specifications

**Notes:**

1. Power-on reset threshold is typically between 1 V and 2 V.
2. Internal clock, internal address bus, and internal data bus are not available externally.

**Figure 10-10. Power-On Reset Timing**

**Notes:**

1. Internal clock, internal address bus, and internal data bus are not available externally.
2. The next rising edge of the internal clock after the rising edge of  $\overline{\text{RESET}}$  initiates the reset sequence.

**Figure 10-11. External Reset Timing**

### 11.2 Introduction

Package dimensions available at the time of this publication for the TK68HC05J1A are provided in this section. The packages are:

- 20-pin plastic dual in-line package (PDIP)
- 20-pin small outline integrated circuit package (SOIC)

To make sure that you have the latest case outline specifications, contact one of these:

- Local Tekmos Sales Office
- Tekmos, Inc
  - Phone 512-342-9871
  - EMAIL [sales@tekmos.com](mailto:sales@tekmos.com)
- Worldwide Web (www) at <http://www.tekmos.com>

# Mechanical Specifications

## 11.3 20-Pin Plastic Dual In-Line Package (PDIP)

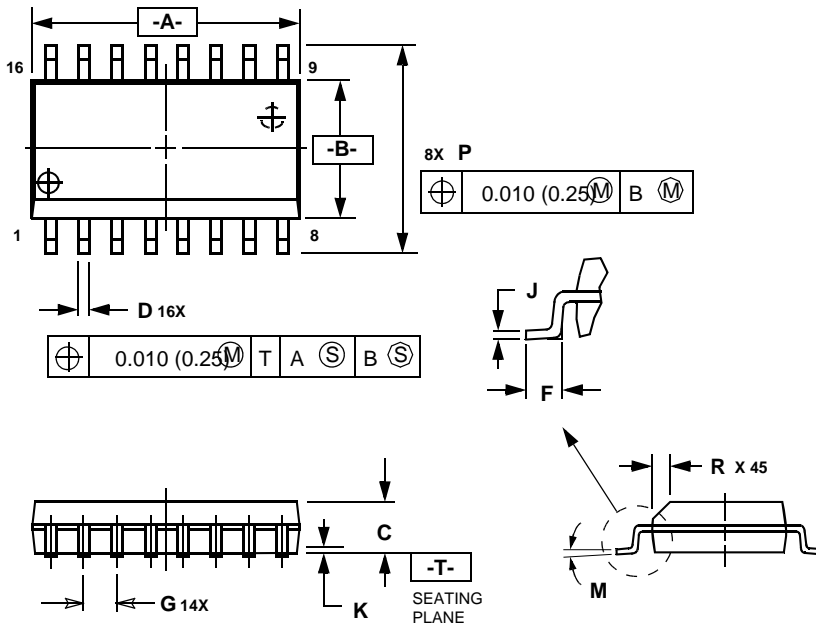

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
  2. CONTROLLING DIMENSION: INCH.
  3. DIMENSION L TO CENTER OF LEAD WHEN FORMED PARALLEL.
  4. DIMENSION B DOES NOT INCLUDE MOLD FLASH.

### 12.2 Introduction

This section contains instructions for ordering custom-masked read-only memory (ROM) microcontroller units (MCU).

### 12.3 MCU Ordering Forms

To initiate an order for a ROM-based MCU, first obtain the current ordering form for the MCU from a Tekmos representative. Submit these items when ordering MCUs:

- A current MCU ordering form that is **completely filled out** (Contact your Tekmos sales office for assistance.)
- A copy of the customer specification if the customer specification deviates from the Tekmos specification for the MCU
- Customer's application program on one of the media listed in [12.4 Application Program Media](#)

The current MCU ordering form is also available through the worldwide web (wwwweb) at <http://www.Tekmos.com>

### 12.4 Application Program Media

Deliver the application program to Tekmos in one of these media:

- Macintosh®<sup>1</sup> 3 1/2-inch diskette (double-sided double-density 800 Kbytes or double-sided high-density 1.4 Mbytes)
- MS-DOS®<sup>2</sup> or PC-DOS®<sup>3</sup> 3 1/2-inch diskette (double-sided double-density 720 Kbytes or double-sided high-density 1.44 Mbytes)
- MS-DOS® or PC-DOS® 5 1/4-inch diskette (double-sided double-density 360 Kbytes or double-sided high-density 1.2 Mbytes)
- Erasable, programmable read-only memory(s) (EPROM) 2716, 2732, 2764, 27128, 27256, or 27512 (depending on the size of the memory map of the MCU)

Use positive logic for data and addresses.

---

1. Macintosh is a registered trademark of Apple Computer, Inc.

2. MS-DOS is a registered trademark of Microsoft, Inc.

3. PC-DOS is a registered trademark of International Business Machines Corporation.

## 12.5 Diskettes

If submitting the application program on a diskette, clearly label the diskette with this information:

- Customer name
- Customer part number
- Project or product name
- Filename of object code
- Date
- Name of operating system that formatted diskette
- Formatted capacity of diskette

On diskettes, the application program must be in Tekmos's S-record format (S1 and S9 records), a character-based object file format generated by M6805 cross assemblers and linkers.

**NOTE:** *Begin the application program at the first user ROM location. Program addresses must correspond exactly to the available on-chip user ROM addresses as shown in the memory map. Write \$00 in all non-user ROM locations or leave all non-user ROM locations blank. See the current MCU ordering form for additional requirements.*

If the memory map has two user ROM areas with the same addresses, then write the two areas in separate files on the diskette. Label the diskette with both filenames.

In addition to the object code, a file containing the source code can be included. Tekmos keeps this code confidential and uses it only to expedite ROM pattern generation in case of any difficulty with the object code. Label the diskette with the filename of the source code.

### 12.6 EPROMs

If submitting the application program in an EPROM, clearly label the EPROM with this information:

- Customer name
- Customer part number
- Checksum
- Project or product name
- Date

**NOTE:** *Begin the application program at the first user ROM location. Program addresses must correspond exactly to the available on-chip user ROM addresses as shown in the memory map. Write \$00 in all non-user ROM locations. See the current MCU ordering form for additional requirements.*

Submit the application program in one EPROM large enough to contain the entire memory map. If the memory map has two user ROM areas with the same addresses, then write the two areas on separate EPROMs. Label the EPROMs with the addresses they contain.

Pack EPROMs securely in a conductive IC carrier for shipment. Do not use Styrofoam®<sup>1</sup>.

### 12.7 ROM Program Verification

The primary use for the on-chip ROM is to hold the customer's application program. The customer develops and debugs the application program and then submits the MCU order along with the application program.

Tekmos inputs the customer's application program code into a computer program that generates a listing verify file. The listing verify file represents the memory map of the MCU. The listing verify file contains the user ROM code and may also contain non-user ROM code, such as self-check code. Tekmos sends the customer a computer printout of the listing verify file along with a listing verify form.

---

1. Styrofoam is a registered trademark of The Dow Chemical Company.

To aid the customer in checking the listing verify file, Tekmos will program the listing verify file into customer-supplied blank EPROMs or preformatted Macintosh or DOS disks. All original pattern media are filed for contractual purposes and are not returned.

Check the listing verify file thoroughly, then complete and sign the listing verify form and return the listing verify form to Tekmos. The signed listing verify form constitutes the contractual agreement for the creation of the custom mask.

## 12.8 ROM Verification Units (RVUs)

After receiving the signed listing verify form, Tekmos manufactures a custom photographic mask. The mask contains the customer's application program and is used to process silicon wafers. The application program cannot be changed after the manufacture of the mask begins. Tekmos then produces ten MCUs, called RVUs, and sends the RVUs to the customer. RVUs are usually packaged in unmarked ceramic and tested to 5 Vdc at room temperature. RVUs are not tested to environmental extremes because their sole purpose is to demonstrate that the customer's user ROM pattern was properly implemented. The ten RVUs are free of charge with the minimum order quantity but are not production parts. RVUs are not guaranteed by Tekmos Quality Assurance.

## Ordering Information

## Appendix A. MC68HCL05J1A

### A.1 Contents

|     |                                         |     |

| A.4 | MC Ordering Information . . . . .       | 119 |

### A.2 Introduction

This appendix introduces the MC68HCL05J1A, a low-power version of the MC68HC05J1A. All of the information in this document applies to the MC68HCL05J1A with the exceptions given in this appendix.

### A.3 DC Electrical Characteristics

The data in **10.7 5.0-Volt DC Electrical Characteristics** and **10.8 3.3-Volt DC Electrical Characteristics** applies to the MC68HCL05J1A with the exceptions shown in [Table A-1](#), [Table A-2](#), [Table A-3](#), and [Table A-4](#).

**Table A-1. Low-Power Output Voltage ( $V_{DD} = 1.8\text{--}2.4\text{ Vdc}$ )**

| Characteristic                                                                                         | Symbol   | Min            | Typ    | Max        | Unit |

| B.4 | Control Timing . . . . .                | 123 |
| B.5 | TK Ordering Information . . . . .       | 124 |

### B.2 Introduction

This appendix introduces the TK68HSC05J1A, a high-speed version of the TK68HC05J1A. All of the information in this document applies to the TK68HSC05J1A with the exceptions given in this appendix.

### B.3 DC Electrical Characteristics

The data in **10.7 5.0-Volt DC Electrical Characteristics** and **10.8 3.3-Volt DC Electrical Characteristics** applies to the TK68HSC05J1A with the exceptions given in **Table B-1**.

**Table B-1. High-Speed Supply Current**

| Characteristic                                                                       | Symbol   | Min | Typ <sup>(1)</sup> | Max  | Unit          |
|--------------------------------------------------------------------------------------|----------|-----|--------------------|------|---------------|
| Supply current ( $V_{DD} = 4.5\text{--}5.5\text{ Vdc}$ , $f_{OP} = 4.0\text{ MHz}$ ) | $I_{DD}$ | —   | 4.5                | 6.0  | mA            |
| Run <sup>(2)</sup>                                                                   |          |     | 2.5                | 3.25 | mA            |
| Wait <sup>(3)</sup>                                                                  |          | —   | 0.2                | 10   | $\mu\text{A}$ |
| Stop <sup>(4)</sup>                                                                  |          |     | 2.0                | 20   | $\mu\text{A}$ |
| 25°C<br>–40°C to +85°C                                                               |          |     |                    |      |               |
| Supply current ( $V_{DD} = 3.0\text{--}3.6\text{ Vdc}$ , $f_{OP} = 2.1\text{ MHz}$ ) | $I_{DD}$ | —   | 2.0                | 4.0  | mA            |
| Run                                                                                  |          |     | 1.0                | 2.0  | mA            |
| Wait                                                                                 |          | —   | 0.1                | 5.0  | $\mu\text{A}$ |
| Stop                                                                                 |          |     | 1.0                | 10   | $\mu\text{A}$ |
| 25°C<br>–40°C to +85°C                                                               |          |     |                    |      |               |

1. Typical values reflect average measurements at midpoint of voltage range at 25°C.
2. Run (operating)  $I_{DD}$  measured using external square wave clock source with all inputs 0.2 V from rail. No dc loads. Less than 50 pF on all outputs.  $C_L = 20\text{ pF}$  on OSC2.
3. Wait  $I_{DD}$  measured using external square wave clock source with all inputs 0.2 V from rail. No dc loads. Less than 50 pF on all outputs.  $C_L = 20\text{ pF}$  on OSC2. All ports configured as inputs.  $V_{IL} = 0.2\text{ V}$ ,  $V_{IH} = V_{DD} - 0.2\text{ V}$ . OSC2 capacitance linearly affects wait  $I_{DD}$ .
4. Stop  $I_{DD}$  measured with  $OSC1 = V_{DD}$ . All ports configured as inputs.  $V_{IL} = 0.2\text{ V}$ ,  $V_{IH} = V_{DD} - 0.2\text{ V}$ .

## B.4 Control Timing

The data in **10.9 5.0-Volt Control Timing** and **10.10 3.3-Volt Control Timing** applies to the TK68HSC05J1A with the exceptions given in **Table B-2** and **Table B-3**.

**Table B-2. High-Speed Control Timing ( $V_{DD} = 5.0\text{ V} \pm 10\%$ )**

| Characteristic                                                                                                                | Symbol               | Min | Max | Unit |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------|-----|-----|------|
